FOREWORD

The Government of India has set an ambitious target of imparting skills to 30 crores people, one out of every four Indians, by 2020 to help them secure jobs as part of the National Skills Development Policy. Industrial Training Institutes (ITIs) play a vital role in this process especially in terms of providing skilled manpower. Keeping this in mind, and for providing the current industry relevant skill training to Trainees, ITI syllabus has been recently updated with the help of Media Development Committee members of various stakeholders viz. Industries, Entrepreneurs, Academicians and representatives from ITIs.

The National Instructional Media Institute (NIMI), Chennai, has now come up with instructional material to suit the revised curriculum for **Cosmetology Trade Theory NSQF (LEVEL - 3) (Revised 2022) in Beauty & wellness** Sector under Yearly Pattern. The NSQF Level - 3 Trade Practical will help the trainees to get an international equivalency standard where their skill proficiency and competency will be duly recognized across the globe and this will also increase the scope of recognition of prior learning. NSQF (LEVEL - 3) (Revised 2022) trainees will also get the opportunities to promote life long learning and skill development. I have no doubt that with NSQF (LEVEL - 3) (Revised 2022) the trainers and trainees of ITIs, and all stakeholders will derive maximum benefits from these Instructional Media Packages IMPs and that NIMI's effort will go a long way in improving the quality of Vocational training in the country.

The Executive Director & Staff of NIMI and members of Media Development Committee deserve appreciation for their contribution in bringing out this publication.

Ms. TRISHALJIT SETHI

Addl. Secretary/Director General (Training)
Ministry of Skill Development & Entrepreneurship,
Government of India.

New Delhi - 110 001

PREFACE

The National Instructional Media Institute (NIMI) was established in 1986 at Chennai by then Directorate General of Employment and Training (D.G.E & T), Ministry of Labour and Employment, (now under Directorate General of Training, Ministry of Skill Development and Entrepreneurship) Government of India, with technical assistance from the Govt. of Federal Republic of Germany. The prime objective of this Institute is to develop and provide instructional materials for various trades as per the prescribed syllabus under the Craftsman and Apprenticeship Training Schemes.

The instructional materials are created keeping in mind, the main objective of Vocational Training under NCVT/NAC in India, which is to help an individual to master skills to do a job. The instructional materials are generated in the form of Instructional Media Packages (IMPs). An IMP consists of Theory book, Practical book, Test and Assignment book, Instructor Guide, Audio Visual Aid (Wall charts and Transparencies) and other support materials.

The trade practical book consists of series of exercises to be completed by the trainees in the workshop. These exercises are designed to ensure that all the skills in the prescribed syllabus are covered. The trade theory book provides related theoretical knowledge required to enable the trainee to do a job. The test and assignments will enable the instructor to give assignments for the evaluation of the performance of a trainee. The wall charts and transparencies are unique, as they not only help the instructor to effectively present a topic but also help him to assess the trainee's understanding. The instructor guide enables the instructor to plan his schedule of instruction, plan the raw material requirements, day to day lessons and demonstrations.

IMPs also deals with the complex skills required to be developed for effective team work. Necessary care has also been taken to include important skill areas of allied trades as prescribed in the syllabus.

The availability of a complete Instructional Media Package in an institute helps both the trainer and management to impart effective training.

The IMPs are the outcome of collective efforts of the staff members of NIMI and the members of the Media Development Committees specially drawn from Public and Private sector industries, various training institutes under the Directorate General of Training (DGT), Government and Private ITIs.

NIMI would like to take this opportunity to convey sincere thanks to the Directors of Employment & Training of various State Governments, Training Departments of Industries both in the Public and Private sectors, Officers of DGT and DGT field institutes, proof readers, individual media developers and coordinators, but for whose active support NIMI would not have been able to bring out this materials.

Chennai - 600 032

EXECUTIVE DIRECTOR

ACKNOWLEDGEMENT

National Instructional Media Institute (NIMI) sincerely acknowledges with thanks for the co-operation and contribution extended by the following Media Developers and their sponsoring organisation to bring out this IMP (**Trade Theory**) for the trade of **Cosmetology** under the **Beauty & Wellness** Sector for ITIs.

MEDIA DEVELOPMENT COMMITTEE MEMBERS

Smt. Sunita Bhat	-	ADT, NSTI, (W), Jammu
Smt. Ruchi Chamoli	-	Training Officer, NSTI, (W), Noida
Smt. Jyoti Balwani	-	Training Officer, NSTI, (W), Noida
Smt. Rajni Soni	-	Vocational Instructor, NSTI, (W), Allahabad

NIMI - COORDINATORS

Shri.Nirmalya Nath	-	Deputy Director, NIMI-Chennai - 32.
Shri. G. Michael Johny	-	Manager NIMI - Chennai -32.

NIMI records its appreciation of the Data Entry, CAD, DTP Operators for their excellent and devoted services in the process of development of this Instructional Material.

NIMI also acknowledges with thanks, the invaluable efforts rendered by all other staff who have contributed for the development of this Instructional Material.

NIMI is grateful to all others who have directly or indirectly helped in developing this IMP.

INTRODUCTION

TRADE PRACTICAL

The trade practical manual is intended to be used in workshop. It consists of a series of practical exercises to be completed by the trainees during the course of the **Cosmetology** trade supplemented and supported by instructions/informations to assist in performing the exercises. These exercises are designed to ensure that all the skills in compliance with NSQF (LEVEL - 3) (Revised 2022)

The manual is divided into Thirteen modules.

- | | | |
|-----------|---|--|
| Module 1 | - | Personality Development |
| Module 2 | - | Superfluous hair (Threading, tweezing and bleaching) |
| Module 3 | - | Manicure & Pedicure |
| Module 4 | - | Facial & Skin analysis |
| Module 5 | - | Shampooing & Conditioning |
| Module 6 | - | Common hair problem |
| Module 7 | - | Hair cutting & blow dry |
| Module 8 | - | Yoga |
| Module 9 | - | Make up |
| Module 10 | - | Hair styling |
| Module 11 | - | Hair Coloring |
| Module 12 | - | Straightening/ Rebonding /Smoothening |
| Module 13 | - | Beauty concept |

The skill training in the shop floor is planned through a series of practical exercises centred around some practical project. However, there are few instances where the individual exercise does not form a part of project.

While developing the practical manual a sincere effort was made to prepare each exercise which will be easy to understand and carry out even by below average trainee. However the development team accept that there is a scope for further improvement. NIMI, looks forward to the suggestions from the experienced training faculty for improving the manual.

TRADE THEORY

The manual of trade theory consists of theoretical information for the course of the **Cosmetology** Trade. The contents are sequenced according to the practical exercise contained in the manual on Trade practical. Attempt has been made to relate the theoretical aspects with the skill covered in each exercise to the extent possible. This co-relation is maintained to help the trainees to develop the perceptual capabilities for performing the skills.

The Trade theory has to be taught and learnt along with the corresponding exercise contained in the manual on trade practical. The indicating about the corresponding practical exercise are given in every sheet of this manual.

It will be preferable to teach/learn the trade theory connected to each exercise atleast one class before performing the related skills in the shop floor. The trade theory is to be treated as an integrated part of each exercise.

The material is not the purpose of self learning and should be considered as supplementary to class room instruction.

Project Work/Industrial Visit			

Personality development

Objectives : At the end of this lesson you shall be to

- **define personality development**
- **explain desirable qualities to cultivate**
- **describe hygiene rules for good health and personality**
- **determine basics of good grooming.**

Personality development

Personality is the key to a successful career in cosmetology. Personality can be defined as the outward reflection of inner feeling, habits, attitudes and values. It is the total effect you have on other people.

Desirable qualities to cultivate

- Attitude
- Behavior
- Thoughts
- Pleasant voice
- Emotional stability

- Be gracious
- Good manners
- Be well groomed
- Have a sense of humor

Hygiene rules

To improve health and appearance, you must follow hygienic rules :

Balance diet: Eat well-balanced meals, drink sufficient amount of water every day, avoid over eating. (Fig 1)

Fig 1

Cleanliness: Keep the body and hair cleaned and odor free, wear clean clothes keep your hand and nail clean etc

Good posture: Stand, sit and walk with good posture.

Sufficient exercise: Exercise and recreation, in the form of running, walking, dancing, sports and gym activities develop endurance and keep the body fit. (Fig 2)

Adequate sleep: An adequate amount of sleep, not less than seven hours is necessary.

Fig 2

Healthy thoughts: The mind and body operates as a unit. A healthy body and mind contributes to a good life and think positive.

Basic of good grooming : To keep your appearance at its best, you must give daily attention to all the important details that make for a clean, neat and charming personality.

Daily bath and deodorant: Keep the body clean by taking daily shower or bath.

Oral hygiene: Clean and brush the teeth regularly.

Hair care: Clean, healthy hair is an asset. Keep the hair clean and lustrous. Wear an attractive and practical hairstyle at all the times.(Fig 3)

Fig 3

Working on grooming poise

Objectives : At the end of this lesson you shall be to

- define body posture
- explain correct standing ,walking and sitting poise
- explain how to hold accessories
- define wardrobe planning
- determine importance of colour, illusion and fashion in wardrobe planning
- explain beauty as a career.

Define body posture : Correct posture, is very important as it helps to prevent fatigue, improves personal appearance and grace in relation to everyday work.

Care of your clothes: Wear neat and clean, properly fitted clothes. The clothing your wear should be suitable for your work.

Hand and nail care: Keep your hands clean and smooth, and always have your nails well manicured. Keep the nail slightly rounded or straight across the top.(Fig 4)

Fig 4

Skin care and cosmetics: Use the correct cosmetics to maintain your skin tone. Keep your make up fresh, eye brows and lips well-shaped. A daily routine of skin care is a must for everyone.

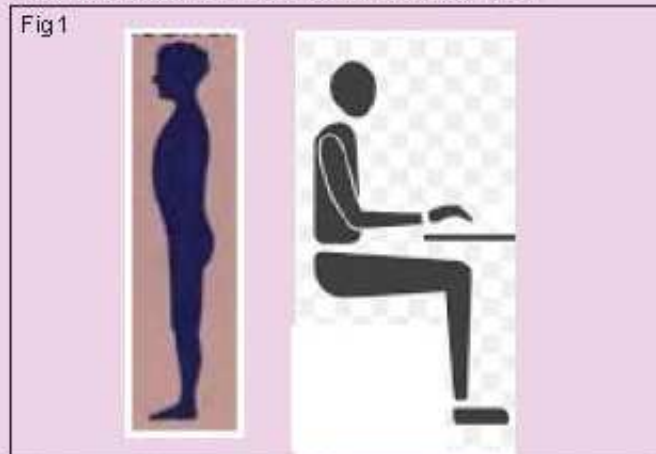

Footwear: Wears well-fitted and sensibly styled shoes. Keep the shoes shined and in good condition.(Fig 5)

Fig 5

Explain correct standing, sitting and walking

Standing : When standing, turn your body slightly, to make the front view look slim and tall. (Fig 1)

Walking : Walking should be smooth, gliding, rhythmic action, that conveys an air of ease and confidence. Feet should be parallel to each other. Shoulder should be relaxed so that arms will swing easily, head should be up. Do not take too long or too short steps and walk with as little noise as possible.

High heels are often responsible for poor posture, malformed feet, and aching backs. The weight of the body is thrown forward, putting a strain on the feet and back.

Low, broad heels give the body support and balance which help to maintain good posture. Low-heeled shoes are more comfortable and tend to offset fatigue resulting from prolonged standing.

Sitting : Never fall into a chair. Glide gracefully into a sitting position. When sliding to the back of the chair, place both hands on the front edge of the chair, at the sides of the hips raise the body slightly and slide back. Do not wiggle back.

Explain how to hold accessories : If you are right handed, you probably carry your briefcase, backpack, handbag, umbrella, gloves, and other accessories with your left hand so that your right hand will be free. The points that follow refer to right handed person switch hands if you are left handed.

Define wardrobe planning : A good wardrobe plan is one that fits in your individual needs. You can gather ideas from book, magazines and classes but you alone can put together a plan that fits your need. You need a wardrobe tailored to fit your personal needs with clothing suitable for all occasions. Your clothes should suit your lifestyle and body type as well as occasion. Selection of clothes should be (Fig 2).

- According to age
- According to body structure
- According to occasion
- According to profession
- According to season

Fig 2

Determine importance of colour, illusion and fashion in wardrobe planning

Illusion : Lines can be used to create illusion or impressions. Your eyes tend to follow a line, and repeating the line gives it more emphasis.

Vertical lines create height and make you look slimmer. Horizontal lines make you shorter and heavier.

Color: Color is the magic word when planning your wardrobe. Determine your correct color from color selection and then decide on a basic color for your wardrobe in the past, basic colour has been black, brown or navy blue. We have more freedom today in selecting a basic color.

Fashion: Clothing fashions change, just as hair fashions change. They change from the simple to the complex and back to the simple. Skirt lengths and waistlines go up and down. Read the newspaper and fashion magazines. They will tell you what is in fashion and what the fads are. They will give you an idea of what the fashion trends will be.

Motivation : Cosmetology (beauty culture) offers the opportunity for a lifetime career in one of our largest and most respected industries after completing a comparatively short training period, you will be prepared to embark upon a career that can offer you a good income for your entire working life. One aspect that sets cosmetology apart from other career areas is the opportunity to develop a one on one relationship with each client this fusion of interpersonal and artistic skills is what makes cosmetology unique and so much fun.

The future outlook: The future for the cosmetology industry appears to be most promising. New techniques, new products, and new opportunities appear every day. The number of patrons who visit beauty salons and the amount of money they spend for services are constantly increasing.

Beauty as a career : Many career opportunities are available to the well trained cosmetologist. Acquiring a

license to practice cosmetology opens doors to a great variety of lucrative careers. The following tables list many of the income are available to cosmetologists. (Fig 3)

Fig 3

Beauty salon opportunities

A General cosmetologist

B Specialties

- Permanent wave technician
- Hairstylist
- Wig stylist
- Hair straightening technician
- Hair colorist
- Hair and scalp specialist
- Skin care specialist (esthetician)
- Manicurist
- Makeup artist
- Mehndi artist
- SPA therapist

C Management

- Salon owner
- Salon manager or supervisor

Educational opportunities

A Technical school management

- Owner
- Department head
- Supervisor

B Teaching guidance

- Teacher of cosmetology
- Teacher of related subjects
- Teacher of specialties
- Trainer of teachers

C Government

- Training Officer
- Vocational Instructor
- Guest lecturer
- Examiner (AITT)

Industry and writing opportunities

A Merchandising

- Buyer and assistant buyer
- Salesperson - direct seller

B Scientific and manufacturing

- Demonstrator or manufacturer's representative
- Researcher - assistant
- Trade technician

C Writing

- Beauty editor - assistant
- Promotional writer
- Free lance writer

Note: Cosmetology is as exciting as it is profitable. It represents to many men and women a profession that will bring much happiness and financial independence.

Communication skills

Objectives : At the end of this lesson you shall be to

- define professional ethics
- define client consultation
- define telephone etiquettes
- explain purpose of telephone services
- state basic rules for telephone etiquettes
- explain importance of communication skill.

Define professional etiquettes : Ethics deal with the proper conduct and business dealings of cosmetologists in relation to their employers, client, and co-workers.

Ethical conduct helps to build confidence and increase patronage. The individual cosmetologist should live up to the following rules of ethics.

- Give courteous and friendly service to all clients.
- Treat all clients honestly and fairly; do not show favoritism.
- Be fair, courteous, and show respect for the feelings and rights of others.

- Practice only the highest standard of sanitation at all times
- Pay attention to the minor details that will make clients like you.
- Be cordial when greeting clients in person or over the telephone.
- Be cordial when greeting patrons in person or over the telephone.
- Listen attentively when others speak.
- Address clients by their names.
- Train yourself to be capable and efficient in your work.
- Be punctual in arriving at work and keeping appointments.
- Plan each day's schedule. Avoid long waiting periods.
- Learn to talk intelligently about your work
- Avoid criticizing, condemning, or complaining.

Define client consultation : Client consultation is very essential before giving any cosmetology service. Once you know what client wants and expects, determine what can actually be done what the service. Compromise, if necessary so that both of you will be happy with the finished service.

For example if a client comes for permanent waving listen carefully to what he or she expects. Ask about the client's life style and commitment to maintaining the hair. Work with photographs if necessary but point out how the curl will look on her. Use other clients or co-workers as examples. Ask your client to sign a consent form. This guarantees the client is aware of the procedures and risks associated with the perm service and agrees to them.

Define telephone etiquettes : An important part of the salon business is handling over the telephone good telephone habits and techniques make it possible for the salon owner and cosmetologist to increase business and win friends with each call, you have a chance to build up the salon's reputation by rendering high caliber service. (Fig 1)

Explain purpose of telephone services : The telephone services may useful purposes in the salon, such as

- Make or change appointments.
- Go after new business.
- Remind patrons of needed services.
- Answer questions and render friendly service.
- Answer questions and render friendly services
- Adjust complaints and satisfy patrons.
- Receive messages.
- Order equipment and supplies.

Explain importance of communication skill

- A good communication skill contributes to success. A pleasant voice, interesting conversation and the use of good English will serve you well as a professional.
- Conversation involves the use of voice, words, intelligence, charm and personality.
- The correct use of words is vital to the art of conversation. The most serious violation of good speech is the use of slang, vulgarisms, and poor grammar.

Your voice should be used to present you in the most favourable light possible. It should be clear and understandable. If the spoken words cannot be understood, a good voice tone is useless.

Describe basic rules for telephone etiquettes

- Display an interested, helpful attitude, as revealed by the tone of your voice and what you have to say.
- Be prompt. Answer all calls as quickly as possible. Nothing irritates the caller more than waiting for you to answer.
- Practice giving all necessary information to the caller.
- Be tactful. Avoid saying or doing anything that may offend or irritate the caller.
- Clear speech
- Correct speech
- Pleasing tone of voice

Fig 1

Sterilization and sanitation

Objectives : At the end of this lesson you shall be to

- define sterilization and sanitation
- state purpose of sterilization and sanitation
- describe methods of sterilization and sanitation
- explain general sanitary precautions.

Sterilization and sanitation

Sterilization

Sterilization is the process of making an object germ free by the destruction of all kinds of bacteria, whether beneficial or harmful.

Sanitation

The measures applied to promote public health and prevent the spread of infectious diseases are known as sanitation.

Purpose of sterilization and sanitation

Sterilization and sanitation are of practical importance to the cosmetologist because they deal with methods used either to prevent the growth of germs or to destroy them entirely when possible, particularly those which are responsible for infections and communicable diseases.

Describe methods of sterilization and sanitation

Physical agents

Moist heat - Boiling tools in water at 212 F (100c) for 20 minutes.

Steaming - steaming requires a steam pressure sterilizer. It is used in the medical field to kill bacteria .

Dry heat (baking) is used in salons to sterilize sheets, towels, gauze, cotton and similar materials. A dry or cabinet sanitizer is an airtight cabinet containing an active fumigant. The sanitized implements are kept clean being placed in the cabinet until needed. (Fig 1).

Fig 1

Ultra-violet rays in an electrical sanitizer are used in beauty salons to keep implements sanitized. Ultra-violet ray electrical sanitizers are effective for keeping combs, brushes and implements clean until ready for use. (Fig 2)

Fig 2

Chemical agents

Antiseptic: Kills and retards the growth of bacteria. It is mild and safe to use on skin, Hydrogen Peroxide, Formalin, Alcohol, boric acid.

Formalin: Safe and effective sanitizing agent, can be used as an antiseptic/disinfectant, depending on its strength. Formalin composed of approximately 37% to 40% formaldehyde (gas in water).

Alcohol-to sanitize sharp cutting instruments and electrodes. Implements having a fine cutting edge are best sanitized by rubbing the surface with a cotton pad dampened with 70% alcohol. This application prevents the cutting edges from becoming dull.

Prepared commercial products that clean floors, sinks, and toilet bowls, such as Lysol.

Procedure

Wet sanitizer

- Remove all hair from tools and implements.
- Wash tools with soap and water to remove dirt, grease and oils.
- Place tools in wet sanitizer for the required length of time
- Remove tools from sanitizer

- Rinse with clear water, and dry with a clean towel

Dry sanitizer

- A dry cabinet sanitizer is an airtight cabinet containing an active fumigant. The sanitized implements are kept clean by being placed in the cabinet until needed.

How to prepare a fumigant. Place 1 tablespoonful (15 ml) of formalin on a small tray on the bottom of the cabinet. This will form formaldehyde vapors.

Ultra-violet rays sanitizer

- Remove all hair from tools and implements.
- Wash tools with soap and water to remove
- Dirt, grease and oils.
- Place tools in ultra-violet rays sanitizer for the required length of time.
- Remove tools from sanitizer.
- Rinse with clear water, and dry with a clean towel.

Formalin

- 25% solution used to sanitize implements. Immerse implements in the solution for at least 10 minutes. (preparation : 2 parts formalin, 5 parts water, 1 part glycerine)

Alcohol

- Implements having a fine cutting edge are best sanitized by rubbing the surface with a cotton pad dampened with 70% alcohol. This application prevents the cutting edges from becoming dull.
- Electrodes may be safely sanitized by gently rubbing the exposed surface with a cotton pad dampened with 70% alcohol. Then place the articles in a dry sanitizer or ultra-violet ray sanitizer until ready for use.

Lysol

- Liquid Lysol, cleans floors, sinks and toilets

Boric acid

- White crystals, 2-5% solution used to cleanse the eyes

Hydrogen peroxide

- Liquid form of hydrogen peroxide 3-5% solution used on skin and minor cuts
- Store all chemicals in a cool, dry area.
- Keep all containers labeled.
- Keep all containers tightly covered.
- Do not taste, smell, or shake any unlabeled liquids.
- Read the labels on all products carefully.
- Follow manufacturer's directions when mixing and using chemicals.
- Wipe up any spilled chemicals immediately.
- Keep chemicals away from the eyes.
- Keep a first aid kit in the salon.

Explain general sanitary precautions

- Wear clean neat and washable cloths.
- Wash your hands carefully after using bathroom.
- Wash your hand before working on client.
- Keep stations and equipments clean.
- Always disinfect equipment after each use.
- Do not work on a client who has a contagious disease.
- Do not allow animals in the saloon.

Temporary removal of superfluous hair

Objectives : At the end of this lesson you shall be to

- describe hair growth cycle
- define the meaning of superfluous hair and it's purpose
- describe the various methods of removing unwanted hairs
- determine the contra actions, contraindications
- after care and do & don'ts.

Describe hair growth cycle (Fig 1)

Hair grows under the skin in follicles. Hair is developed by blood vessels, which provide nourishment from it. Between the rising and falling sequence of hair, each hair goes through four stages: anagen, catagen, telogen, and exogen. Every hair can be in a different phase of the growth cycle at any time.

Sometimes, the anagen phase length is reduced. Therefore, the hair may become weaker and thinner after each cycle. This is why your diet should contain important nutrients to ensure a healthy diet.

Stages of hair growth cycle:

- 1 **Anagen (Growing Phase) :** The growing phase lasts 2-7 years and determines the length of our hair.
- 2 **Catagen (Transition Phase) :** This is the transitional stage that lasts about 10 days. The hair follicle shrinks and detaches from the dermal papilla.
- 3 **Telogen (Resting Phase) :** This is the resting phase which lasts around three months. Around 10-15 percent of hairs are in this phase. Whilst the old hair is resting, a new hair begins the growth phase.
- 4 **Exogen (New hair phase) :** This is part of the resting phase where the old hair sheds and a new hair continues to grow. Approximately 50 to 150 hairs can fall out daily, this is considered to be normal hair shedding.

Note: If hairs enter the resting phase too early, excess shedding and noticeable thinning can occur.

Define the meaning of superfluous hair and its purpose

Introduction

The technical name for superfluous hair is hypertrichosis, in this condition excessive hair growth can be seen on women, on different areas of the body such as the face (especially around the upper lip and chin), breasts, back and abdomen.

Causes of superfluous hair

- Some causes of the condition include stress, obesity, genetics.
- Over sensitive hair follicles.
- High level of testosterone and follicle stimulating hormone.
- Certain drugs/medicines.

Describe the various methods of removing unwanted hairs

Unwanted hair growth can be the result of hormonal imbalances, which can be treated with hormone therapy. But at times there is no hormonal problem, or if it has already been treated, the unwanted hair can be removed via various hair removal methods.

Methods of hair removal

Methods of hair removal fall into two categories;

Depilation and epilation

Depilation

In this method hair are removed from skin top only.

There are various methods of depilation such as

- | | |
|------------------|---------------------|
| a Abrasive paper | b Pumice stone |
| c Shaving | d Depilatory creams |
- a **Abrasive paper (Fig 2) :** Abrasive paper is rubbed against the skin for removing hair. This method was used in the early times. Abrasive paper, leaves cuts & rashes on the skin. This method is outdated now.

Fig 2

b Pumice stone (Fig 3) : It is a porous stone which removes hair from skin top only. Pumice stone comes in many shapes - Square, triangular, oval, etc. It is a very slow process of removing hair. It is never used in beauty parlours. By this method hair on legs and arms can be removed. It is never used to remove facial hair.

Fig 3

c Shaving (Fig 4) : Shaving can remove the hair at the surface of the skin. Now day's women are using certain shaving razors on their face, but they are useful only on peach fuzz. Shaving gives quick, smooth results and is suitable for under arms and legs. Special models of shavers designed especially for the female body hair are also available. Otherwise razors are of two types.

Fig 4

i Manual razor ii Electric razor

Electric razors give good results. Apply a body lotion or cream after using a razor.

d Depilatory creams (Fig 5) : Depilatories are chemicals that dissolve the hair so that it can be wiped or washed. They are easily found over the counter, for face, arms and legs and bikini area. Be careful using a depilatory cream on the face, never apply near the eyes or too close to mouth. Always read and follow the instructions given by the manufacture carefully.

Fig 5

Note:

- Always perform a patch/allergy test of 24 hours prior to applying a depilatory cream.
- Apply a small amount of depilatory cream behind the ear. Leave it on for 15 minutes and then remove. If there is no reaction (redness or swelling) after 24 hours, proceed with the treatment.

Epilation

It means that the hair is removed below the skin. Hair is removed from the roots.

The various methods of epilation are:

- Tweezing
- Threading
- Waxing

a Tweezing (Fig 6)

Fig 6

This is used to remove small amounts of hair. Tweezers are used to shape the eyebrows, but they can be used elsewhere or to remove ingrown hair. Tweezers come in a variety of designs and shapes.

There are 2 types of tweezers they are:

- **Manual tweezers:** It comes in different variety of style find the most suitable for you.
- **Electric tweezers:** One of the methods of hair removal employs electric tweezers. As the name implies, electrically charged tweezers are used to pull the hair. Because each hair must be removed individually, as with ordinary tweezers, this method is very slow.
- b **Threading (Fig 7) :** This method is used to remove small amounts of hair, like to shape the eyebrows, removing hair from upper lip, chin, forehead and removing scattered hair form elsewhere. A thick thread usually 40 number is used to remove hair. Threading is a method of hair removal originating in India and Central Asia. In more recent times it has gained popularity in Western countries. It also requires a lot of practice to perfect this technique.

Fig 7

- c **Waxing (Fig 8) :** This is an effective method for removing unwanted hair in large and small areas. There are two types of waxes:

Fig 8

- Hot wax
- Cold wax

Hot wax (Fig 9) : This is basically a paraffin wax, This is directly heated on a heater and applied with a wooden spatula in the direction of hair growth. Hot wax does not use strips. This wax must be applied in thick layers so that there is enough to grasp when it is pulled off. This wax is usually used to remove hair from small area e.g. upper lips, eyebrows, chin, etc.

Fig 9

Cold wax (Fig 10) : These come in a semisolid form. It is made up of sugar, citric acid/lemon juice. They are heated in a thermostatically controlled warmer or indirectly on heat. They are applied with spatula in the direction of hair growth. The cold wax is applied thinly and removed with strips of cotton or muslin cloth. These used to remove hair from large area e.g. legs, arms and underarm. When using wax, be sure to follow the manufacturer's directions carefully. If not done properly, waxing can be quite painful. It requires a lot of practice to perfect this technique.

Fig 10

- d **Wax strips (Fig 11) :** Wax strips are the most convenient and easy to use hair removal, at the ease of your home method. They are easy to use. Veet is the most popular brand in India. (Fig 12)

Fig 11

Fig 12

DEPILATION				EPILATION				
								
2-3 days	1-2 weeks	2-4 weeks					forever	
								
razor	depilation cream	tweezing	threading	waxing	sugaring	mechanical epilator	IPL	laser

Determine the contra actions, contraindications

Contra-indications related to the removing of unwanted hairs temporarily

Contra-indication can be classified into those that restrict prevent treatment. In other words restrict means you can adapt your treatment around the contraindication and prevent means you can't treat the client until the condition has cleared up or until they obtain a medical reference.

Contra actions

These may occur during the treatment or after it have taken place. It is important to give your client full and detailed aftercare advice to help prevent these reactions.

The below given problems are some contra actions along with the action required during the treatment.

- 1 Erythema:** It is most commonly occurred after waxing and it should go down within 24 hrs. The client should avoid perfumed products or hot baths until redness has faded.
- 2 Blood spotting:** Commonly occurred on areas of strong hair growth such as underarms and bikini line. The areas should be cleaned with cold damp cotton wool.
- 3 Bruising:** Common on bikini line area. Cold compress applied. It should start to fade after 24 hrs. Some client's are more prone to bruising, for them ensure that you and your client stretch the skin thoroughly during the procedure like waxing. Always note the occurrence on the client's record card.
- 4 Allergic reaction:** The client may react to products at anytime. If you suspect a client is reacting to a product, remove all the traces of the product immediately and apply a cold compress after 24 hrs. they should seek medical advice.

- 5 Broken hairs:** Strong terminal hair can sometimes break during waxing, meaning there will be a quick re-growth. This can occur due to poor technique or inappropriate wax products being used.

After care and do & don'ts

After Care: It is very important to discuss aftercare and homecare with your client during the consultation, so that skin reactions and contra action can be explained and understood.

Aftercare: For a period of 24 hrs

- 1 No sunbathing or sun beds.
- 2 Avoid bathing in sea or swimming pool.
- 3 Do not take a hot bath or shower.
- 4 Do not use deodorant or antiperspirant.
- 5 Avoid tight clothing.
- 6 Don't use perfumed products on the area.
- 7 No make-up or self tanning preparations.
- 8 Do not keep touching or picking at the area.

Dos & don'ts

- 1 Avoid excessive sun exposure.
- 2 Always wear sunscreen.
- 3 Avoid extremely hot bath.
- 4 Avoid harsh/strong lotion or creams.
- 5 Avoid bleaching.
- 6 Keep away from deodorants for few days.
- 7 Wait for full growth.

Bleaching

Objectives : At the end of this lesson you shall be to

- explain the types of bleach
- determine the contra actions and contra indications
- determine aftercare of bleaching.

State the purpose of bleaching

Purpose of bleach: Bleaching is not a method of hair removal but is very popular method to hide or camouflage the hair. This process makes the hair colourless. But it works best on soft hair that grows on the face and arms.

There are various purposes of using bleach, such as:

- to lighten the facial or body hair.
- to remove sun tanning.
- to remove the dead cells.

Explain the types of bleach

Types of bleach

1 Powder or paste bleach (Fig 1)

Fig 1

It is a very cheap method. This paste can be prepared by mixing bleaching powder, ammonium hydroxide (20 volume), hydrogen peroxide (H₂O₂). It can be used on the face, body, arms and legs.

2 Cream bleach (Fig 2): It comes in a cream form. This cream contains H₂O₂ while ammonium hydroxide is packed in a salt form. The mixture can be prepared by mixing both according to the manufacturer's direction. This can be used to bleach facial and body hair.

Fig 2

3 Liquid bleach (Fig 3): This bleach is usually used to bleach scalp hair. It is a mixture of hydrogen peroxide (H₂O₂) and ammonium hydroxide.

Fig 3

Allergic test/patch test

Patch test/Allergy test should be done behind the ears or the inside of the elbow. The patch test must be given 24 hours before bleaching. The bleach used for the skin test must be of the same mixture as the bleach intended to be used for the bleaching service. After performing an allergy test, wait for 24 hours; if you find any redness, swelling or itching then don't do bleaching on the client.

Note: Always perform an allergy test/patch test before using bleach

Determine the contra actions and contra indications

Contra action

- Light burning sensation
- Redness on skin
- Redness in eyes
- Irritation
- Skin dryness

Contra indications

- Hyper sensitive skin
- Skin diseases
- Infections
- Pregnancy
- Cuts and abrasions
- Sun burns

Determine aftercare of bleaching

After care: Do not expose your face to sunlight as the bleached skin may get itchy in reaction to the radiation and sweat and get damaged even more. Cleanse face with cold milk soaked cotton.

Manicure

Objectives : At the end of this lesson you shall be to

- explain the structure of nail
- distinguish between nail diseases & disorders
- definition and the purpose of manicure
- describe the types of manicure
- determine the contra-indications, contra-actions, after care/ home care & do's & don't.

Scan the QR Code to view the video for this exercise

Explain the structure of nail

Structure of the nail

The main structure that you will work with when applying a manicure is the nail. It is a transparent plate that protects the tips of fingers, toes and the nail bed. It is an appendage of the skin. It is important to know the different parts of the nail.

Knowledge of the nail structure will enable you to identify the condition of the nail. You will need to identify whether a nail is healthy or unhealthy. You will also need to know which parts of the nail are responsible for growth, protection, nail shape and size. This knowledge would enable you to prevent damage to the nail during manicure application. The technical name for the nail is Onyx. (Fig 1)

Nail plate : The nail plate consists of keratin and semi-translucent cells packed closely together. It is the visible portion of nail that rests on the nail bed. It extends from the root to the free edge. The nail plate can become dry, brittle and separate into two layers. This condition is caused by wear and tear as well as harsh chemicals.

Free edge : The free edge is the end portion of the nail plate that reaches over the tip of the finger or toe. This is the part of the nail that is filed giving it a desired shape.

Nail groove : Nail groove are slits or tracks at either side of the nail upon which the nail moves as it grows.

Cuticle/eponychium : The cuticle is the overlapping skin at the base of nail. Cuticles become dry from excessive exposure to water and chemicals and also because of the natural aging process. A manicurist/pedicurist pays particular attention to cuticles ensuring that they are well conditioned. They prevent infection of the matrix.

Perionychium : The perionychium is the skin that overlies the nail plate on its sides. It is also known as the paronychia edge. The perionychium is the site of hangnails, ingrown nails and an infection of the skin called paronychia.

Hyponychium : The hyponychium is the area between the nail plate and the fingertip. It is the junction between the free edge of the nail and the skin of the fingertip, also providing a waterproof barrier.

Nail wall : The nail wall is made up of folds of skin overlapping the sides of the nail, providing protection for the nail.

Nail bed : The nail bed is the portion of skin upon which the nail plate rests. It contains blood vessels that provide nourishment for growth. It also contains nerves.

Matrix : New cells are formed in the matrix and they move forward, hardening on the nail bed until they make up the free edge. It contains nerves, lymph, and the blood vessels that nourish the nail; it produces cells that generate and harden the nail. Damage to cells in the matrix will affect the growth of nails.

Lunula : The lunula is seen as a half-moon located at base of nail. It is caused by reflection of light.

Distinguish between nail diseases & disorders

Nail disorders and diseases

Cosmetologists should have a thorough understanding of nail disorders and diseases so they can identify conditions that should not be treated in the salon, identify infectious conditions in order to protect yourself and other clients, and recognize conditions that may signal serious health concerns and should be treated by a doctor.

Normal, healthy nail

- Firm but flexible
- Shiny, smooth, unspotted surface with no ridges/pits/splits
- Whitish and translucent with pinkish nail bed showing through.

Nail infections

- Fungi are parasites that cause infections of the feet and hands.
- Fungi can spread from nail to nail on a client's feet (not likely to spread to hands as fungi like dark, warm, moist places like inside shoes).
- Proper cleaning and disinfection can prevent transmission to other clients.
- Bacteria can cause nail infections on both the hands and feet; bacterial infection can usually be identified by yellow-green spots that become darker in its advanced stages.

NOTE: Cosmetologists should never provide nail services to clients with bacterial or fungal infections.

Nail disorders are a large group of conditions that affect the appearance of fingernails and toenails. Infections caused by bacteria, fungus or viruses, underlying conditions and inherited ailments can all cause abnormalities in the nails.

- 1 **Bruised nails:** a condition where a blood clot forms under the nail plate, causing a dark, purplish spot; usually due to small injuries of the nail bed. (Fig 2)

Fig 2

- 2 **Eggshell nails:** noticeably thin, white nail plates that are more flexible than usual; weaker, can curve over the free edge. (Fig 3)

Fig 3

- 3 **Beau's lines:** visible depressions running across the width of a normal nail; usually result from major illness or injury. (Fig 4)
- 4 **Hang nail-** also known as a snag nail; the living skin around the nail plate splits and tears; result from dry skin or small cuts. (Fig 5)
- 5 **Leukonychia spots-** white spots; whitish discoloration of the nails usually caused by minor injury to the nail matrix. (Fig 6)

Fig 4

Fig 5

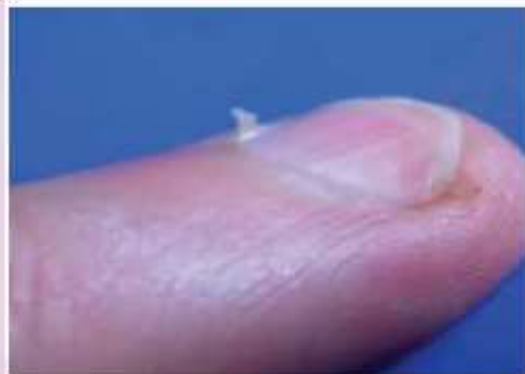

Fig 6

- 6 **Onychorrhexis-** split or brittle nails that have a series of lengthwise ridges giving a rough appearance to the surface of the nail plate; usually the result of injury to the matrix. (Fig 7)

Fig 7

- 7 **Nail pterygium-** abnormal condition where skin is spread by the nail plate (Fig 8) caused by serious injury.

Fig8

- 8 Ridges**- vertical lines running down the natural nail plate caused by uneven growth of the nails; common in aging. (Fig 9)

Fig9

- 9 Pincer (trumpet) nail**- nails with a greater curve due to the curvature of the matrix; can pinch soft tissue of free edge. (Fig 10)

Fig10

- 10 Discolored nails**- turn a variety of colors; may be surface staining, a systemic disorder, or poor blood circulation. (Fig 11)

- 11 Onychophagy**: (bitten nails); result of a habit of chewing nails. (Fig 12)

Nail diseases: or onychosis is a disease or deformity of the nail. Nail diseases have a distinct classification as they have their own signs and symptoms which may relate to other medical conditions.

Fig11

Fig12

- 1 Onychia**: inflammation of the nail matrix followed by shedding of the natural nail plate. (Fig 13)

Fig13

- 2 Onychocryptosis**: ingrown nail, nail grows into the living tissue surrounding the nail. (Fig 14)

Fig14

- 3 Onycholysis**: lifting of the nail plate from the nail bed without shedding; usually the result of trauma. (Fig 15)

Fig 15

- 4 **Onychomadesis:** separation and falling off of the nail plate from the nail bed. (Fig 16)

Fig 16

- 5 **Paronychia:** bacterial inflammation of the tissues surrounding the nail; redness, pus, and swelling are usually seen in the adjacent skin fold. (Fig 17)

Fig 17

- 6 **Onychomycosis:** fungal infection of the natural nail plate. (Fig 18)

Fig 18

7 **Tinea pedis:** fungal infections of the feet. (Fig 19)

Fig 19

Definition and the purpose of manicure

Manicure is the treatment of hands and nails. At one time manicuring treatment is considered a luxury enjoyed only by the rich people. Today it is an essential part of beauty treatment for both men and women.

'Manicure' is a Latin word. This word can be broken up into two words 'manus' meaning hands and nails and 'cure' meaning care. So the meaning of manicure is the care of hands and nails. Manicure is treatment of the hands and nails to make them healthy, smooth and beautiful. (Fig 20)

Purpose of manicure

Manicure is a treatment to improve the look and feel of hands and fingernails. It helps to clean the hands and also to strengthen, shape and dress the nails. Our hand and nails can be prevented from some common problems by regular manicure.

It is a complete care for hands and nail. This treatment makes the nails stronger and healthier. Taking this treatment once in a month is beneficial.

Describe the types of manicure

Types of manicure

Nails like skin are of various types and have varied problems. Each type of nail requires special treatment during manicure and pedicure. As a manicurist and pedicurist you will be required to address the different types of nails and their problems. Thus it is important that you master the different techniques of manicure and pedicure. Let us study of the technique.

There are many types of Manicure. Let us study the techniques of some of the popular ones are:

- 1 **Plain Manicure-** It is a simple type of manicure in which the normal & necessary steps of manicure are included such as cleaning of hands & nails, shaping of nails, massage of hands & nails and nail varnish application.
- 2 **Hot Oil Manicure:** This manicure is for dry and brittle nails. In this manicure the fingers are soaked in warm oil. Olive oil or cuticle oil are used for the soaking purpose.

Fig 20

- 3 Electric Manicure: In this manicure, electric equipment are used instead of hands. Most of the activities of the process are done using special electrical equipment.
- 4 French manicure: It is a manicure technique of high fashion. After manicure, nails edges are finished with white enamel while the nail bed is polished with transparent color. French nails look more natural and realistic. French manicure is very popular due to its great versatility with any fashion or clothing item.

Determine the contra-indications, contra-actions, after care/home care & do's & don't.

Contra indication

Contra indication refers to conditions that require special attention or during which the services cannot be carried out. Some of these are listed below.

- 1 Broken bones
- 2 Ring worm
- 3 Nail fungus
- 4 Recent scar tissue
- 5 Impetigo
- 6 Warts
- 7 Scabies or itch mites
- 8 Severe nail separation (Onycholysis)
- 9 Severe Eczema
- 10 Severe Bruising
- 11 Undiagnosed lumps and swellings
- 12 Athlete foot
- 13 Diabetes- permission from general physician required

Contra- action of manicure

A contra action is something that has happened due to a product or treatment being carried out. Some of these are listed below:

- 1 Erythema: Reddening of skin due to dilation of blood vessels
- 2 Allergic to nail enamel.
- 3 Excessive perspiration
- 4 Allergic to oil
- 5 Cuts
- 6 Inflammation of the cuticle

Aftercare advice

- 1 Wear rubber gloves when washing up to avoid contact with harsh detergents, which may dehydrate the nails and skin.
- 2 Dry the hands thoroughly after washing. Always use hand cream or lotion after washing to lubricate and soften the skin. Some hand creams contain UV filters which reduce hyper pigmentation (seen as darker areas of the skin) to the backs of the hands occurring.
- 3 Use a richer hand cream in the winter months.
- 4 Massage the hands and cuticles each evening with a rich hand cream just before going to bed.
- 5 Do not use the fingernails for tools (for instance, to pry lids off tins)
- 6 Use acetone-free nail varnish remover, as it is less harsh on the nails.
- 7 Eat a balanced diet that contains all the nutrients essential for good / healthy skin and nails.
- 8 Drink plenty of water to keep the skin and nails hydrated.

- 9 Apply strengthening nail products to treat cracking, peeling, splitting and white spots.
- 10 Apply a good top coat every 2-3 days to encourage your manicure to last longer.

Dos and don'ts

- 1 Do moisturise nails and nail beds. Moisturiser will make cuticles look better and help protect nails from breaking due to a lack of hydration. Putting an oil or hand lotion around the cuticle helps moisturise the entire nail, which will reduce the incidence of chipping, cracking, and splitting.
- 2 Do practice good nail hygiene.
- 3 Do keep fingernails dry and clean. This prevents bacteria from growing under fingernails. Repeated or prolonged contact with water can contribute to split nails. Wear gloves when washing dishes, cleaning or using harsh chemicals.

- 4 Don't cut, bite or pick at cuticles. Whether you have your nails professionally groomed or do them yourself, leave your cuticles alone. The cuticle is the natural barrier to fungus and bacteria and manipulating them can lead to infection and damage to the nail bed. While cutting cuticles holds the most potential for harm, pushing them back can cause problems as well.
- 5 Don't use acetone-based polish removers. Acetone strips nails causing them to become brittle. When using nail polish remover, opt for an acetone-free formula.
- 6 Don't use rough emery boards. Old-fashioned emery boards are too harsh for nails, causing small fissures and cracks that lead to breakage and tears. Instead file nails with a smooth, fine file and file slowly and evenly in one direction only to reduce risk of breakage.

Pedicure

Objectives : At the end of this lesson you shall be to

- define and purpose of pedicure
- describe the types of pedicure
- determine the contra-indications, contra- actions
- after care/ home care & do's & don'ts .

Scan the QR Code to view the video for this exercise

Pedicure improves the appearance of the feet and toenails. It also improves blood circulation and has a relaxing effect. The service is similar to manicure.

A pedicure service has many benefits including prevention of nail diseases and nail disorders, cosmetic and therapeutic benefits.

Pedicures involve working on nails, removing dead skin cells on the bottom of feet using a rough stone called pumice stone and other implements. These days leg care below the knee is also included in the pedicure. A regular monthly treatment should keep the feet and toe nails in good condition, although excessive hard skin problems may need more frequent treatments at two or three intervals.

Define and purpose of pedicure

Purpose of pedicure

- To improve the appearance of feet and toenails.
- To relax aching and tired feet.
- To reduce hard skin at the sole of the feet.

Pedicure includes

- Shaping the nails
- Cuticle treatment
- Removal of hard skin
- Specialized foot treatment
- Foot and leg massage
- Nail varnish application

Most of the steps followed in manicure apply to pedicure too. The major differences between the two are:

- positioning of the client
- treatment of hard skin
- treatment area

Describe the types of pedicure

Types of pedicures

- 1 **Regular pedicure:** A regular pedicure is the most common type of treatment for the toes. This method starts with a warm foot soak and a foot scrub. It is followed by clipping the nails, shaping or filing the edges, pushing of cuticles, foot massage, moisturizing and applying a nail polish if client wish. This type of pedicure is suitable for people who prefer a simple and direct maintenance treatment. (Fig 1)

Fig 1

- 2 **French pedicure:** This type of pedicure is a popular trend among women. It has the same procedure as a regular pedicure. However, what makes it different is the style of application of nail polish.

A clear or nude base coat is first applied on nails then followed by an application of a solid white colored nail polish. A French pedicure is a classic nail trend that has been around for a long time. It makes your feet look clean, chic, polished, sophisticated, and stylish. (Fig 2)

Fig 2

- 3 **Paraffin pedicure:** If client have dry and cracked feet, a paraffin pedicure provides excellent results. In this treatment, feet are dipped in paraffin wax to help soften and moisturize the skin. Paraffin consists of an alkaline wax substance that is infused with hydrating properties.

The feet may also be wrapped in plastic before soaking it in the wax treatment. The warm paraffin wax opens up the pores of skin and helps nourish it. This is a popular choice for people who want to have young and soft looking feet. (Fig 3)

- 4 **Hydrating and healing pedicure:** It includes all the necessary steps from the express pedicure. The

only difference in this type of pedicure is that filing of bottom of the foot with exfoliated scrub, application of moisturizing mask and lower leg & foot massage is included.

Fig 3

- 5 **Athletics / sports pedicure:** This type of pedicure is good for sporty and athletic clients. athletes often running, exercising at the gym or participating in other forms of sport, then feet and legs are under more pressure and is prone to wear and tear. Active and sporty people often experience more foot problems including athlete's foot. They usually have thicker calluses, blisters, and nail injuries. This is a procedure during which a beauty therapist will clean and trim your toenails, get rid of dead skin, massage your soles and release muscular tension. At the end of the pedicure, your feet will look clean and tidy and feel fantastic.

Determine the contra-indications, contra- actions, after care, home care & do's & don'ts : Contra-indications: Contra-indication is a condition that either prevents a treatment or may restrict one. For example, a bruised nail may restrict a treatment, while a bacterial or fungal infection will prevent the treatment completely due to the risk of cross-infection.

Contra-indications that prevent treatment

- Multiple warts
- Fungal infections these type of infections spread very rapidly and often thrive in damp areas and can appear soft and spongy. For example: athlete's foot (ringworm of the foot) ringworm of the hand.
- Bacterial infections this type of infection is usually characterised by swelling, tenderness and redness in the area. For example: paronychia, onychia.
- Viral Infections. These infections are very common and treatment can be adapted by using a waterproof dressing and avoiding the area. For example: Verruca vulgaris (common warts), (verruca of the foot).
- Bruised nail
- Cut and aberration on hand or fingers.
- Onychocryptosis (ingrowing nails). This may affect the fingers or toes.

Contra- actions : Contra -actions are the things that can happen after a treatment, so allergic reactions such as - rashes itching, stinging etc. The various contra- actions can be seen after the pedicure treatment are as:

- 1 **Erythema** - Reddening of skin due to dilation of blood vessels, a reaction to external stimulus or infection- Apply cold cream.

- 2 Allergic to nail Enamel- Redness around nail area, also places that have been touched. Watery eyes, itchy skin, rash. Remove enamel, apply cold compress to areas touched also on eyes. Tell the client if the condition doesn't improve within 24 Hrs consult general physician.
- 3 Allergic to oil- Rinse with water, apply cold compress and advise to consult general physician if condition doesn't ease within 24 Hrs.
- 4 Allergic reaction e.g. redness, irritation or swelling, remove product, apply cold compress, seek medical advice if condition persists.
- 5 Heat on the nail plate: Too much pressure during nail buffing in the wrong direction, stop buffing and apply cool compress.
- 6 Skin irritation or inflammation.
- 7 Swelling in the area.
- 8 Heat on the nail plate Redness.

After care & home Care

- To prolong the life of varnish wear suitable gloves or a special barrier cream when completing tasks involving any dirty work or other work involving the use of water or chemicals such as gardening, washing up, hairdressing, car maintenance.
- Do not bite nails or surrounding skin and keep an emery board available to deal with ragged free edges to the nails, so that the temptation to bite is removed.
- Following pedicure treatment please allow adequate time to allow the nails to dry before leaving.
- Use a moisturizing hand cream or lotion regularly.
- Avoid using the nails as tools, use the pads of your fingers instead of your nails.

Do's and don'ts

- 1 Don't polish near a blowing fan.
- 2 Don't file your nails back and forth.
- 3 Don't cut the toe nails in pointed shape.
- 4 Don't apply thick layers of nail varnish.
- 5 Always use acetone free nail polish remover.
- 6 Do wipe nails clean with remover prior to polishing.

Nail art

Product knowledge

- 1 **Matte topcoat:** A matte topcoat is used to non-glossy matte finish.
- 2 **A nail polish correcting pen:** for use clean up around the nail bed, & give professional finish to the nail.
- 3 **Striping tape:** This very thin metallic tape can be applied and kept on nail to enhance your nail art.
- 4 **Transfer foils:** Foil paper creates a cool design when you paint your nails a desired base color, apply a clear

glue over top, and then press and pull the tape away quickly.

- 5 **Dotter tool:** If you want to make tiny or large dots on your nails, or create a design using a series of circles, a dotter tool is the way to go. It creates perfect tiny or large dots in seconds.
- 6 **Striper brush:** It is a small, thin paint brush. This tiny brush helps create thin lines and tricky detail.
- 7 **Nail stickers/wraps:** If you don't have time to create cool nail art, pick up a premade design and press it onto your fingertips for notice-me nails.
- 8 **Good- quality staple shades:** A sheer pink, classic red, and opaque white and black polishes are musts in your nail kit not only because they're classics, but because they're frequently used when creating nail art.
- 9 **LED nail lamp:** Most gel polishes for sale require an LED lamp to cure or harden the nail polish for a longer lasting result.

After care advice

- 1 Re- apply the top coat on the nail every few days to maintain the design.
- 2 Use rubber gloves while cleaning and washing up.
- 3 Stop using the fingernails as tools to scratch labels or remove dirt stuck in crevices.
- 4 Apply cuticle oil to your nail beds every day.
- 5 Do not file your nails unless absolutely necessary. If you need to, take care to file gently and always finish in a downward direction.
- 6 Always wear gloves when doing general household cleaning and gardening, hobbies that are rough on your hands or use harsh chemical products.
- 7 Avoid using your nails as tools to pull open or pick at anything.
- 8 Take care not to use any products that could contain solvent oils, which causes major damage to the colour. These oils can be found in certain sun tan oils and insect repellent.
- 9 To avoid the colour fading on holiday make sure you wash any chlorine off your hands after swimming and dry your nails before sunbathing.
- 10 If any lifting occurs make sure you don't pick or pull at the nail. Call us so that we can assess the nail and decide if a repair is necessary.
- 11 To hide grown out gels add a dab of glitter to the base of each nail and blend up. This not only looks pretty but means you can put off getting refills for another few days.
- 12 Before your next treatment be sure to book in a gel removal to ensure no damage occurs on the natural nail.

Facials

Objectives : At the end of this lesson you shall be to

- **explain consultation techniques**
- **describe the structure of the skin and their functions**
- **describe the types of the skin and identification of common skin problem**
- **meaning of massage, types and their benefits**
- **explain precaution for facial.**

Explain consultation techniques: Client consultations are not only a legal requirement before treatment, but also an opportunity to discover what client wants, along with possible contraindications, and achieve the perfect end result. The client consultation is an extremely important element of the massage process. Even regular clients need a consultation as skin condition can change over time. Through client consultation, follow the following facts to get the correct information.

- Ask questions and listen carefully to, understand the client's desires and requirements.
- Use open questions that require more than a yes or no answer.
- Give the client confidence that the best of service will be given to them.
- Before start working on the client, always check they have no more questions.

Analyze

- 1 Check the area on which the treatment will done. Suggest your ideas to their specific desire, concern or problem.
- 2 Make suggestions according to their skin type and their concern.

Keep a record

- 1 Recording information about each customer allows for a deeper understanding of their needs.
- 2 It is helpful in familiarizing yourself with the customer

- 3 The record should take into account skin allergies, skin conditions and skin sensitivity.
- 4 Keep records up to date also allows identifying other treatments.

Describe the structure of the skin and their functions

Introduction of the skin: The skin is very elastic, durable, and complex. It is the largest organ of the body. On the eyelids, the skin is thin but on the soles of the feet it may be ½ inch thick. A healthy skin is usually a sign of good health. On the other hand, a serious illness often shows it's presence on the surface of the skin. The study of the skin is known as dermatology and a dermatologist is a doctor who specializes in skin treatment.

Structure of the Skin

Skin is made up of three main layers

- 1 Epidermis – Outer layer
- 2 Dermis – Middle layer
- 3 Subdermis – Innermost layer (Fig 1)

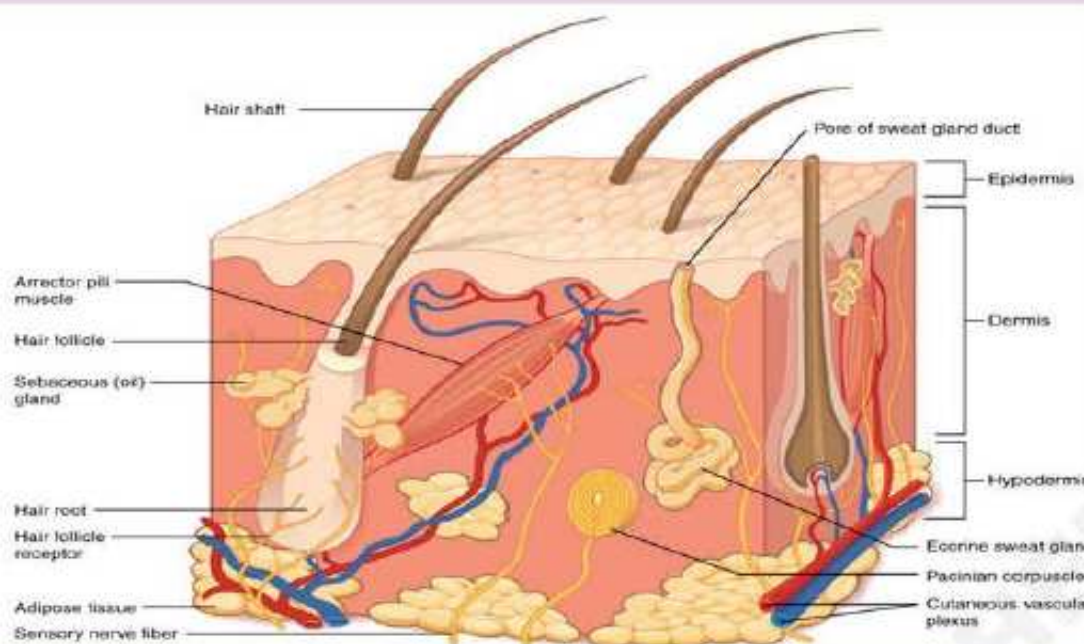

Layers of the Skin

Epidermis consists almost entirely of dead and dying cells. It has almost no blood supply, except in the deepest layer.

The epidermis is further divided into four distinct layers

- The cornified layer (Stratum Corneum)
- The clear layer (Stratum Lucidum)

Fig.1

- The granular layer (Stratum Granulosum)
- The germinative layer (Stratum Germinativum)

Dermis is a true skin made up of many interwoven fibres (not cells) of elastic proteins called collagen which give skin its ability to stretch.

The dermis is divided into two layers

- The papillary layer
- The reticular layer

Subcutaneous is attached to the underlying organs and tissues lies below the dermis.

Functions of the skin : The skin like most organs is vital to overall health and carries out many functions that help us to protect our body.

- **Temperature regulation:** Helps in regulating body temperature.
- **Protection:** It protects the body from - heat, cold, bacteria, excess fluid and harmful elements in the environment.
- **Absorption:** Skin is capable of absorbing necessary substance in a limited way e.g. topical medicine and cosmetics.
- **Sensation:** It is the sensory organ for touch, heat, cold, pain etc. and transmits the information to brain.
- **Secretion:** Skin is well supplied with sebaceous glands which secrete oil that is vital to our skin.
- **Excretion:** Helps in excretion of toxic substances with sweat.

Types of skin : The skin type of each and every person is different. As a beauty expert, your first responsibility is to identify your client's skin type. Because different types of skin require particular kind of care to keep it healthy and beautiful. The four skin types used in the beauty industry are:

- **Normal skin:** Even skin tone with no flaking or oily sheen. This is a rare skin type.
- **Dry skin:** Tight, dull complexion with flaky or itchy patches.
- **Oily skin:** Enlarged pores and an oily sheen.
- **Combination skin:** Oily T-Zone with dry patches on the cheeks or elsewhere.

There is one more, but it's not a skin type but a skin condition, you have to deal with condition in salon most often

Sensitive skin: Skin that is sensitive to touch or products. Can result in redness or a rash. (Fig 2)

Describe the types of the skin and identification of common skin problem

Common skin problems

As a beauty therapist you will encounter a large number of skin problems which you will need to identify and take care of. Remember some skin disorders can be treated in the salon while some skin diseases need to be referred to a medical practitioner.

Skin disorders

- 1 **Acne:** When the pores that allow oil to reach the skin surface become clogged, pimples can form. Sometimes these pimples get worse and take the shape of acne. Serious cases of acne should be referred to a dermatologist. (Fig 3)
- 2 **Blackheads or comedones:** They are also caused by clogged pores. Sebum hardens and forms a plug. Steaming is helpful to clear up this condition. You can use black head extractor to remove them after steaming. (Fig 4)
- 3 **Whiteheads or milia:** They result when sebum accumulates beneath the surface of the skin. (Fig 5)

Fig 2

Fig 3

Fig 4

Fig 5

Milia

White heads

- 4 Steatoma or warts:** It is a sebaceous cyst. This is a tumor of the sebaceous glands that forms under the skin. They vary in size. (Fig 6)

Fig 6

- 5 Asteatosis:** In this condition sebaceous glands secrete very little sebum and the skin becomes very dry and scaly. It occurs most frequently in older people. (Fig 7)

Fig 7

- 6 Seborrhea:** In this condition sebaceous glands are over active. The surface of the skin becomes very oily and shiny. (Fig 8)

Fig 8

- 7 Hyperhidrosis:** This problem causes abnormal sweating even in winters. (Fig 9)

Fig 9

- 8 Prickly heat or miliaria rubra:** This is inflammation of the skin around the skin pores. It appears in the form of small red pimples with itching. (Fig 10)

Fig 10

9 Dehydrated: The skin looks tight and has criss cross lines or broken capillaries. (Fig 11)

Fig 11

10 Hyper pigmentation: Increased pigment production causing an uneven complexion with dark patches on the skin. (Fig 12)

Fig 12

11 Hypo pigmentation: Decreased pigment production causing an uneven complexion with light patches on the skin. (Fig 13)

Fig 13

Meaning of massage, types and their benefits : The word massage is derived from the Arabic word 'Masa', meaning to "touch" or "stroke". Massage is a scientific method of manipulation of the body by rubbing, pinching or stroking with the hands, or fingers or an instrument.

The beneficial effects produced by massage depend upon the type, intensity and extent of the manipulations employed. Massaging must be performed systematically. It should never be a casual or irregular process.

Types of massage

1 Effleurage: This is light, continuous movement applied in a slow and rhythmic manner over the skin. No

pressure is applied. Over large surfaces, the palm is used, while over small surfaces, the fingertips are employed. Effleurage is frequently applied to the forehead, face and scalp for its soothing and relaxing effects. (Fig 14)

Fig 14

2 Petrissage: In this movement, the skin and flesh are grasped between the thumb and fingers. As the tissues are lifted from their underlying structures, they are squeezed. Rolled or pinched with a light, firm pressure. This movement exerts an invigorating effect on the part being treated. (Fig 15)

Fig 15

3 Friction: This movement requires pressure on the skin while it is being moved over the underlying structures. The fingers or palms are employed in this movement. Friction has a marked pressure on the circulation and glandular activity of the skin. (Fig 16)

Fig 16

4 Percussion or tapotement: Tapotement is a movement that consists of fast tapping, drumming, Patting, or hacking the skin. Its commonly use in sports and medical massage, its stimulating effects. It is done in rhythmic and manner with the pads of the finger or the sides of the palms. It increases blood circulation and promotes muscles contraction. (Fig 17)

5 Vibrations: The fingertips or vibrator are used to transmit a trembling movement to the skin and its underlying structures. To prevent over-stimulation,

this movement should be used sparingly and should never exceed a few seconds duration on any one spot. (Fig 18)

Fig 17

Fig 18

Benefits of massage

- Dead cells are loosened and shed, improves the appearance of the skin.
- The muscles receive an improved supply of oxygenated blood, essential for cell growth. Muscle are toned up and improved.
- The increased blood circulation in the area warms the tissues.
- Blood capillaries are dilated and bring blood to the skin surface, this improves skin color.
- The increased temperature of the skin relaxes the pores and follicles; this helps absorption of the massage cream.
- Sensory nerves can be soothed or stimulated, this helps to maintain the skin natural oil and moisture balance (sebaceous glands increase the production of sebum and sweat)
- The skin and all its structure are nourished and soften lines and wrinkles.
- The skin is rendered soft and pliable.

- The lymphatic circulation and the venous blood circulation increases, helps to remove waste products and toxins.

Explain precaution for facial

- For excessive black heads steaming is necessary to soften the skin.
- Use black head remover to remove black heads.
- Sanitize the tool first and apply astringent on the area before and after removing black heads.
- Use tissue papers while removing black heads.
- Use ice cubes immediately after removal of black heads to close the pores of skin.
- Use preferably distilled water in the steamer.
- Use clean towels and linen for each client
- Check the temperature so that it does not cause any discomfort to the client.
- Do not steam beyond 2 to 3 minutes and check for temperature in between.
- Wash hand before and after treatment.
- Check that the client has no infectious conditions.
- Using a spatula to remove products from jars.
- Replacing tops on bottles and jars immediately after use to avoid contamination.
- Sterilizing all implements before use.
- Keep checking the client's skin reaction during treatment.
- Keep the steam outlet directed away from the client and any other equipment/materials while the water is heating.
- Always follow the manufacturer's instructions regarding preparation, application and removal.
- Turn the steam outlet away from the client before turning the machine off and move it to a safe place immediately after treatment.
- It is important to ensure that the mask is set before removal.
- Apply soothing eye pads once the mask application is complete.
- Remove masks with damp warm sponges or cotton pads using an upward motion.
- Repeat until all traces of the mask have been removed and finally apply a light application of toner before proceeding to the last stages of the facial.

Structure of hair

Objectives : At the end of this lesson you shall be to

- define hair
- define structure of hair root and hair shaft
- describe chemical composition of hair
- determine PH knowledge of hair
- define hair growth cycle
- describe types of hair
- define hair texture, density, elasticity and porosity.

Hair: Hair is an appendage of the skin, it is a thread-like outgrowth of the skin and scalp of the human body.

The study of hair, technically called trichology.

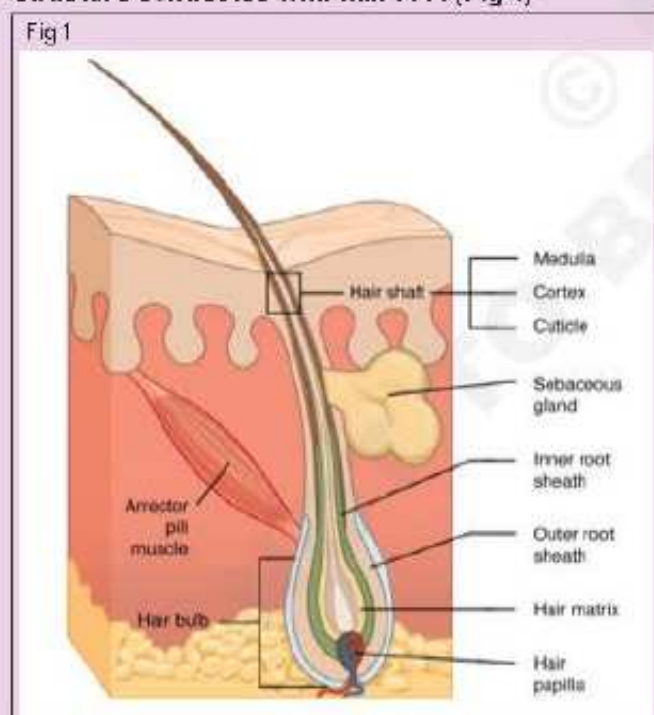

Structure of hair root and hair shaft

There are two main divisions of hair - hair shaft and hair root.

Hair shaft - the hair which is above the surface of the scalp and is seen, is termed as hair shaft.

Hair root - the portion of the hair which is beneath the skin, is termed as hair root. A variety of structures are connected with the hair root. They are the follicle, the hair bulb, and the hair papilla.

Structure connected with hair root (Fig 1)

Hair follicle - hair follicle is a pocket-like tube in the skin or scalp that encases the hair root. Each hair has a follicle which varies with the situation and thickness of the skin and hair. Oil glands are attached to hair follicle for supply of sebum.

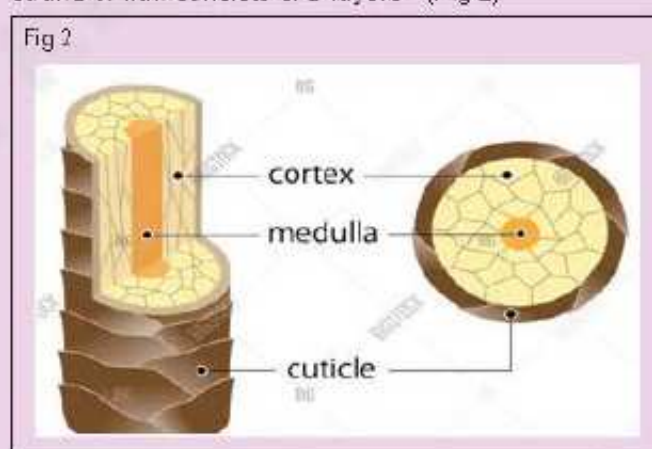

Hair bulb - the hair root looks like a bulb as lowermost.

Papilla - It is a cone-shaped structure which fits into the hair bulb. Papilla is richly supplied by blood and nerves. Growth and regeneration of the hair takes place in this part. Once the papilla is damaged, new hair can never grow.

Arrector pili - arrector pili is a small involuntary muscle attached to the underside of a hair follicle. Cold weather and sudden fear make the hair stand and in this situation arrector pili muscle controls the position of the hair follicle.

Sebaceous gland - These are sac-type clusters of gland open into the hair follicle. The gland secretes sebum which spreads along the length of the hair then to the skin, keeping them (skin and hair) soft, supple and shiny.

Although hair looks very small to the naked eye, each strand of hair consists of 3 layers - (Fig 2)

Cuticle - The outermost layer of the hair consists of horny cells which look like fish scales and this layer is known as cuticle.

Cortex - This layer lies just below the cuticle. This portion forms major part of the hair and gives strength and elasticity to the hair.

Medulla - This is the innermost part of the hair. Sometimes medulla may be absent in lanugo hair.

Chemical composition of hair

Hair is composed of a protein called keratin, which is present in all horny growths, such as nails.

The chemical composition of hair varies with its color.

The average hair is composed of:

Carbon	-	50.85%
Hydrogen	-	6.36%
Nitrogen	-	17.14%
Sulfur	-	5.0%
Oxygen	-	20.85%

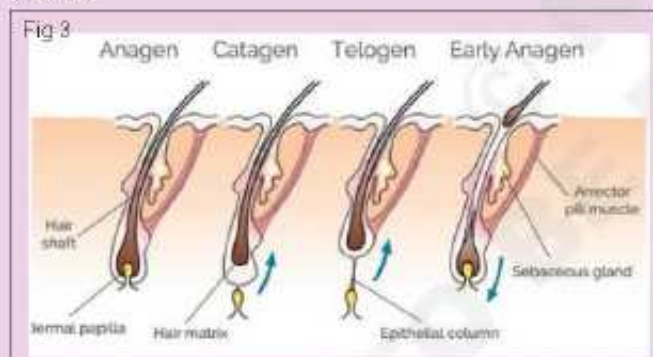

pH knowledge of hair : Hair reacts quite differently to two different chemical substances known as acids and alkalins. The test for finding out the different chemicals is done by a litmus paper. Red Litmus Paper turns blue in an alkaline solution whereas Blue Litmus Paper turns red in acid solution.

pH scale: The symbol pH means potential of Hydrogen.

The pH scale is a number scale is used to measure acidity and alkalinity of a solution. The scale ranges from 0 - 14. pH 7 is neutral. pH values below 7 are acidic; the lower the number, the stronger the acid. pH value above 7 are alkaline; the higher the number, the stronger the alkali.

Although the precise neutral point on the scale is 7.0, the neutral range is considered to extend from pH 6.5 - 7.5. The pH of the skin's & hair's acid mantle ranges from 4.5 - 6.0 is most often referred to as 5.5.

Hair growth cycle : Hair follicles grow in repeated cycles. One cycle can be broken down into three phases. (Fig 3)

- 1 Anagen - Growth Phase
- 2 Catagen - Transitional phase
- 3 Telogen - Resting Phase

In healthy individuals each hair goes through a cycle of events, growth, and fall and is replaced by another hair. As a result, a certain amount of hair is shed everyday. Old hair falls out to make place for new hair. In average, 60 - 100 hair is lost per day quite naturally. Average growth rate in each hair is $\frac{1}{2}$ inch - $\frac{7}{8}$ inch per month. A scalp hair continues to grow for 2 - 7 years. Eyebrows and eyelashes are replaced every 4 - 5 months

Types of hair : Types of hair are determined by the presence of sebum and pH condition of the hair.

There are three types of hair :

Normal hair: a normal amount of sebum is secreted from the sebaceous gland of a person with normal hair. Normal hair should be kept in medium length.

Dry hair: a less amount of sebum is secreted from the sebaceous gland of a person with dry hair. Dry hair should be kept short to prevent it from damage.

Oily hair: excess amount of sebum is secreted from the sebaceous gland of a person with oily hair. Oily hair should be kept long, to prevent the scalp from seborrheic condition.

Hair texture, density, elasticity and porosity

Hair texture : Texture refers to the thickness or fineness and feel of the hair. Thickness depends on the diameter of the hair. Texture of hair is its size and quality. (Fig 4)

Fig 4

Thickness - hair may be coarse and thick, medium, fine and very fine in texture.

Feel of the hair - according to feeling, hair maybe soft and smooth, harsh, rough and wiry in texture.

Wave of hair - according to wave present or absent in hair, it maybe straight, wavy and curly.

Hair density : Density refers to the number of hair per sq. inch. More the number of hair, more the density. Hair can have dense, moderate and thin density. For dense hair smaller blocking and larger rods should be used. For thinner hair smaller blocking and smaller rods should be used.

Hair porosity

Porosity is the ability of the hair to absorb water. This ability is not connected with the thickness of the hair but is connected with the state of the cuticle layer. Hair can have poor, good or excessive porosity. Excessive porosity is connected with damaged hair and it should be handled carefully for chemical services.

Hair elasticity

Hair elasticity is the ability of the hair to stretch and go back to its normal length without breaking. Normal hair can be stretched to one-fifth of its length. Hair can have poor, good or normal elasticity. Hair with poor elasticity is not suitable for chemical services.

Head Massage

Objectives : At the end of this lesson you shall be to

- explain the purpose of head massage
- explain consultation techniques
- explain different massage movements
- state benefits of head massage
- state precautions of head massage.

Purpose of head massage

The two basic requirements for healthy scalp are cleanliness and stimulation . It is based on ancient healing system of ayurveda. The head massage is great for relieving the stress and tension in our everyday lives. Head massage is most effective when given in a sequence once a week for normal scalp .

Explain consultation techniques

The therapist needs to obtain relevant details from the client before commencing a massage treatment .

The therapist must be professional in her manner and make the client feel welcome.

Personal details should be taken and recorded on a record card. These should include medical history, and contraindication that may be present and the treatment required. If in doubt , a letter of approval should first be obtained from the client's doctor .

Questioning the client on expectations and outcomes can ensure the client gain satisfaction from the treatment . The client will also require a postural check at the time of consultation. Once the consultation is complete , the therapist should ensure that all the details are recorded and that the client has signed her consent card.

Product knowledge

- | | | |
|------------------------------------|---|--|
| 1 Any vegetable oil | - | For giving the massage. |
| 2 Scalp steamer | - | For giving the steam and opening of follicles. |
| 3 Essential oil | - | For aroma. |
| 4 Vibrator | - | For improving blood circulations. |
| 5 High frequency | - | For improving blood circulation and also improves granular activity. |
| 6 Hair shampoo (According to hair) | - | For cleaning the hair and scalp |
| 7 Conditioner | - | For improving condition of the hair and giving shine. |

Explain different massage movement

These are Several massage movement which are selected according to the desired effect. Each massage movement place the hand under the hair so that the length of the fingers, balls of the finger tips and cushions of the palms can stimulate the muscles, nerves and blood vessels of the scalp area.

Basic scalp manipulation

Effleurage (Stroking)

Effleurage movements have a sedating and relaxing effect on the skin . They are performed with the whole palm. Effleurage always commences and completes a massage routine.

Petrissage

Petrissage is the technical name of kneading movement. This rolling and gentle squeezing of the muscles under the skin increases circulation of blood and lymph and stimulates muscles for toning effect.

Friction

Friction is a circular , deep rubbing movement . friction greatly increases circulation and is used most commonly on the scalp, arms and hands . Friction is used with less pressure in scalp manipulation .

Tapotement

Tapotement is a movement that consists of tapping or lightly slapping the skin. It is done in rhythmic and manney with the pads of the finger or the side of the palms. It increases blood circulation.

Procedures of head massage

- 1 Prepare the client - by draping towel, relaxing on chair.
- 2 Comb the hair free of tangles.
- 3 Part the hair into 4 sections
- 4 Make 1" parting on each section and apply the selected oil or tonic. Rub in well to the scalp.
- 5 Begin the Massage.

Step 1

- Begin at the hairline, from the front of the ear to the top of the head.
- Using the pads of the fingers, do a rotating massage. Press the fingers firmly, but do not scratch with the nails. Curve the hand so that the palms do not rest on the client's head, giving weight.
- Count 1-2-3 to massage to a rhythm.
- Repeat 3 times.
- Follow the same procedure on the second line. The sides of the head above the ears to the top of the head.
- Repeat 3 times.

- Begin from behind the ears to the top of the head.
- Repeat 3 times.
- Cupping the hand, using the palms and the heel of the hand, massage the back of the head with the same rotary movement.
- Repeat 3 times.
- Place the hands on the nape of the neck and massage giving attention to the neck.
- Repeat 3 times.
- Standing on the side of the client, place one hand on the top of the forehead and other at the base of the neck and massage towards the crown till the fingers meet.
- Repeat the entire massage procedures 3 times without breaking contact.

Step 2

- Using the tip of the fingers give friction movement on the head.
- Follow clockwise and anticlockwise movements to a rhythm. Make sure the hair is not pulled. Pressure should be given to the scalp without hurting but relaxing the client.
- Repeat 3 times.

Step 3

- Using the palms gently tap the head to a rhythm, beginning from one ear to the other, going around the head in a circular pattern.
- Repeat 3 times.

Step 4

- First step again
- Begin at the hairline from the front of the ear to the top of the head.
- Using the pads of the fingers do a rotating massage, begin from behind the ears to the top of the head.
- Cupping the hand, using the palms and the heel of the hand, massage the back of the head with the same rotary movement.

- Place the hands on the nape of the neck and massage giving attention to the neck.
- Standing on the side of the client, place one hand on the top of the forehead and the other at the base of the neck and massage towards the crown till the fingers meet.
- Repeat 3 times.

Step 5

- Complete the massage with a gentle stroking movement of the entire head.
- Repeat 4-6 times
- If oils are used for the massage 10 to 15 minutes of steaming under a head steamer is recommended.

Benefits of massage

- 1 Relaxation of the nerves .
- 2 Relief from the body tension
- 3 Increases blood circulation
- 4 Relieves eye strain
- 5 Ease headache and migraine
- 6 Stimulates the hair and scalp
- 7 Dead cells are removed by the head massage.
- 8 Hair follicles are stimulated.

Precautions

- Creams or ointments may be applied before using high-frequency current. Hairtonics or lotions with alcoholic content may be applied only after the application of high-frequency current.
- If there are scalp abrasions, or if there is a scalp disorder do not suggest a scalp treatment.
- Immediately prior to the application of a lightener, tint, toner, permanent wave, or a chemical hair relaxing treatment.

Shampooing, conditioning & deep conditioning

Objectives : At the end of this lesson you shall be to

- state the purpose of shampooing
- explain the types of shampoo
- explain the benefits of shampooing
- precautions for shampooing.

State the purpose of shampooing

The purpose of shampoo is to clean the hair and scalp and remove dandruff, dirt, and cosmetics. Shampoo also increase the circulation of blood and stimulate the scalp. there are many kinds of shampoo available in the market

and cosmetologist should know what shampoo is best for what type of hair. Main ingredient of the shampoo is distilled water .

Product knowledge

- Hair shampoo according to hair.
- Coconut shampoo for dry hair.

- Egg shampoo for greasy and dry hair.
- Medicated shampoo helps maintain the normal state of the hair.
- Treatment shampoo variety of shampoos to deal with a specific problems.
- Pre-perm shampoo used before perming.

Explain the types of shampoo

Many shampoo brands are designed for use with particular types of hair and scalp conditions. It is important that you read the label carefully so that you know how to use the product properly.

Other types of shampoo are

Dry shampoo: Powder brushed on to hair and are then brushed out. They don't really clean, but it's a good stop gap if you can't shampoo.

Baby shampoo: these are meant for babies. Who have fine hair and not much of it. It's not strong enough for an adult, even if used every day.

Shampoo for colour treated hair: These need to be rich in moisturizers and protein to return water to the shaft. they should be low in alkalinity, it should not have sulphated castor oil that will strip colour.

Shampoo for processed hair: These need to be rich in moisturizers and protein to return water to the shaft. they should be low in alkalinity.

Daily use shampoos: These are very gentle and have low amounts of cleanser and usually contain conditioner.

Procedure

- 1 Take the client to the wash area with the cape and the towel intact.
- 2 Wet the scalp and hair.
- 3 Take a small amount of shampoo and spread it all over the scalp.
- 4 Give effleurage movement for at least three of five minutes.
- 5 Circular movements can also be done for next three minutes to remove dirt and dandruff.
- 6 Rinse off the shampoo thoroughly with plenty of water.
- 7 See to it that water does not drip on the client's face or spoil the client's dress.
- 8 Squeeze out the excess water from the hair and apply conditioner to the mid lengths and ends of the hair.
- 9 Emulsify the conditioner well all over the mid length and ends and leave on for next three minutes.
- 10 Now rinse off the conditioner thoroughly from the hair.
- 11 Remove the cap and pick up the towel from the client's shoulder, wrap around the head taking care that the water does not drip on the client's face or dress.

- 12 After removing the shampoo cape use the setting brush or comb and hand dryer, dry the hair thoroughly.

Benefits of shampoo

- 1 Reduces irritation
- 2 Good for coloured hair
- 3 Reduces the dryness of the scalp
- 4 Reduces hair loss
- 5 Reduces the frizzles

Procedure for shampooing & rinsing

- 1 Take the client to the wash area with the cape and the towel intact.
- 2 Wet the scalp and hair.
- 3 Take a small amount of shampoo and spread it all over the scalp.
- 4 Give effleurage movement for at least three of five minutes.
- 5 Circular movements can also be done for next three minutes to remove dirt and dandruff.
- 6 Rinse off the shampoo thoroughly with plenty of water.
- 7 See to it that water does not drip on the client's face or spoil the client's dress.
- 8 Squeeze out the excess water from the hair and apply conditioner to the mid lengths and ends of the hair.
- 9 Emulsify the conditioner well all over the mid length and ends and leave on for next three minutes.
- 10 Now rinse off the conditioner thoroughly from the hair.
- 11 Remove the cap and pick up the towel from the client's shoulder, wrap around the head taking care that the water does not drip on the client's face or dress.
- 12 After removing the shampoo cape use the setting brush or comb and hand dryer, dry the hair thoroughly.

Procedure for deep conditioning

- Hair can get dried out and damaged from the use of heat styling tools, dyes and chemical strengtheners, and exposure to the sun and cold air. It is good to restore hair's moisture and body with a good deep conditioning treatment.

Choose a product

There are many products in the market, and you should find one that's made to order for your exact needs.

- If you have fine hair, look for products that are described as "Light or weightless".
- Products made with heavier oils will make the hair look weighted down.

Apply the deep conditioning product

- Apply conditioner directly onto your head. Smooth it from your roots down your hair shaft. Gives special attention to the tips, which tend to get drier than the rest of your hair. If necessary, use a wide-tooth comb to distribute the product.

Cover the head with plastic cap

- Deep conditioning treatments require a number of hours to set in and get to the centre of each strand of hair. Keep the conditioning in place by covering head with a plastic cap.
- Avoid using a material other than plastic, since fabric or other materials might absorb the product.

Apply heat

- After Applying the conditioner to give heat with help of dryer, this allows it to get absorbed into hair more easily. Make sure the hair dryer doesn't get too hot, since you don't want to melt the plastic cap.

Rinse out the product

- Remove the shower cap and rinse your hair with cool water, Which will tighten the hair shaft and make it look shiny. After rinsing, towel dry hair gently, then let it air dry and style the hair.

Precautions for shampooing, conditioning and deep conditioning

- 1 Make sure cape and towel are fastened securely.
- 2 Check water temperature before wetting the clients head.
- 3 Avoid scratching the clients scalp with your finger nails while giving the shampoo.
- 4 Read the instructions for all special shampoos.
- 5 Always clean and sanitize shampoo bowl after each use.
- 6 Modern conditioners help chemically treated hair.
- 7 Conditioners strengthen and moisture the hair.
- 8 Deep conditioning softens and smooth tight curly hair or coarse hair.
- 9 It counteracts the effect of hairdressing processes.

Common hair problems

Objectives : At the end of this lesson you shall be to

- state common hair problem
- define hair structure
- explain science about hair structure.

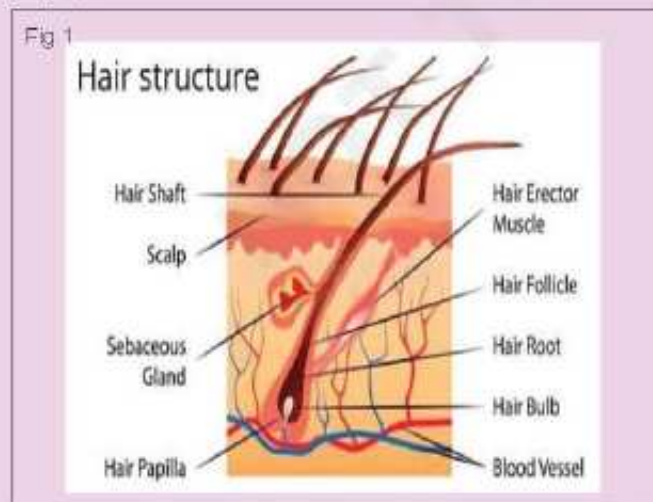

Introduction of common hair problems

The average person has 5 million hair. Hair grows all over your body except on your lips, palms, and the soles of your feet. It takes about a month for healthy hair to grow half an inch. Most hair grow for up to six years and fall out new hair grow in their place. Hair comes in different styles, colours, lengths, textures and types. Yet no matter what kind of hair you have, just about every one falls prey to at least one hair problem.

People suffer from hair problems. Almost every second person suffer from one or the other hair problem. Hair fall, dandruff, grey hair, rough hair, oiliness, infection of scalp, infections like lice and nits, hair thinning, bulkiness of hair. These you can name as natural problems. Apart from these, there are These are man created problems like - damaged hair, unkempt hair, not well dressed hair, rough permed hair, rough textured hair, etc. These hair problem sometimes aggregate so much that people tend to get frustrated, tensed, depressed. To avoid this, one should take regular hair care for taking proper care of hair it is necessary to know about the cause of these problems and their solution.

Hair structure

Hair is an appendage of the skin thin offers protection to your body, helps you to look attractive and plays a big part in supporting the billion dollar cosmetic industry. Scientific study of hair is called trichology. It is composed of proteins, keratin, which is found also in skin and nails. (Fig 1)

Divisions of hair

Human hair divided into two parts

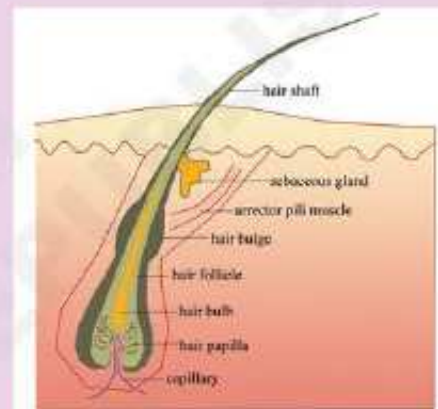

The hair root: It is that portion of the hair structure located beneath the skin surface. It is that portion of hair which is enclosed in the follicle.

The hair shaft : It is that portion of the hair structure extending about the skin surface.

Hair root

The hair which is anchored in the follicle, lies below the surface of skin is referred as the hair root. (Fig 2)

Fig 2

Structures attached to the hair root

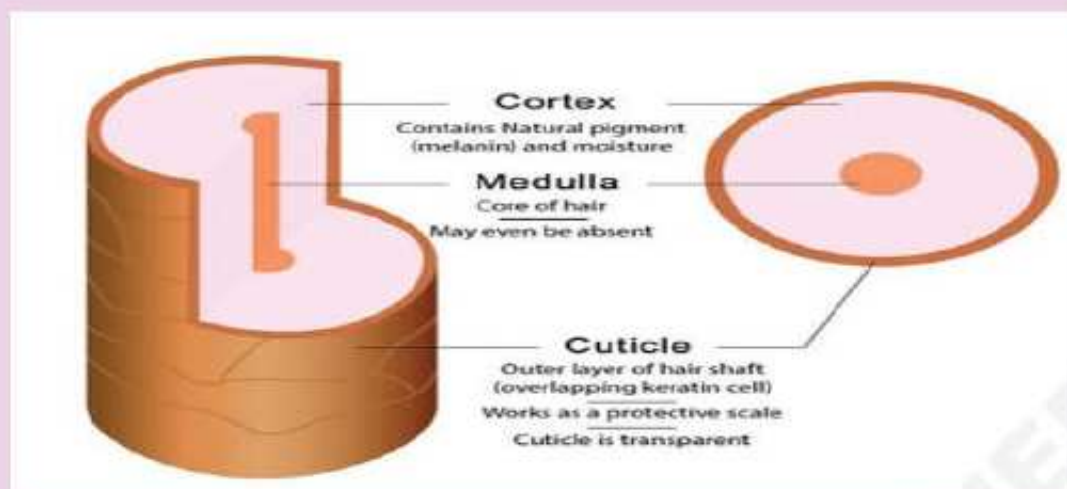

There are five main structures which are attached to the hair root.

- Hair follicle:** Resemble like a tube in the skin that encloses hair root each hair has its own root and follicle. One or more glands are attached to the follicle. The follicle is set at an angle and hair floss on the scalp in that direction.
- Hair bulb:** Thick bulb shaped structure which forms the lower part of the root fit the bottom, bulb is hollow to fit over and cover hair papilla.
- Hair papilla:** Small cone shaped elevation located at the bottom of the hair bulb. Papilla gets blood supply from nerves, which contributes to the hair. As long as the papilla is healthy and nourished, hair will grow.
- Arrector pili muscle :** It is a small involuntary muscle attached to the follicle fear and cold causes them to contract, which gives "gooseflesh" or "goose bumps".
- Sebaceous gland:** It is a gland in the skin that opens into a hair follicle to secrete an oily matter, called serum, which lubricate the hair and skin.

Hair shaft: The hair shaft is the part of the hair not anchored to the follicle, and much of this is exposed at the skin's surface. (Fig 3)

Layers of skin shaft : Hair shaft is consisted of three layers: Cuticle, cortex and in certain causes medulla.

Fig 3

- Cuticle layer:** It is the outermost horny layer of hair shaft. It is composed of transparent overlapping protective scale like cells. It serves as protection to cortex. These cells work defensively to prevent damage to the hair's inner structure and to control water content of hair fiber. When the cells are raised, solutions are able to enter into the cortex layer.
- Cortex layer:** It is second layer, which gives strength and elasticity to the hair. It contains pigment, elastic fibre and sulphur bonds. It is located between the cuticle and medulla and comprises 70% of the hair strand. Cortex is made of keratin and natural ceramide. Pigment in the cortex, named MELANIN is responsible for hair colour. Melanin consists of blue, red and yellow pigments which gives hair its natural colour. Absence of melanin means grey/ white hair services such as chemical hair relaxing, thermal styling, wet setting and hair colouring oxidation causes temporary and permanent change to the hair. These changes take place in the cortex layer.
- Medulla:** It is the third an inner layer of the hair. It is composed of round cells. It is only seen in large and thick hairs. Very fine hair does not have medulla. Curly and wavy hair has good medulla. Naturally blonde and fine hair generally does not have a medulla. The function of this layer of hair does not affect the hair care services conducted by salon professionals it has no clear function as defined. It appear that the cells composing medulla rapidly degenerate, leaving space for bubbles.

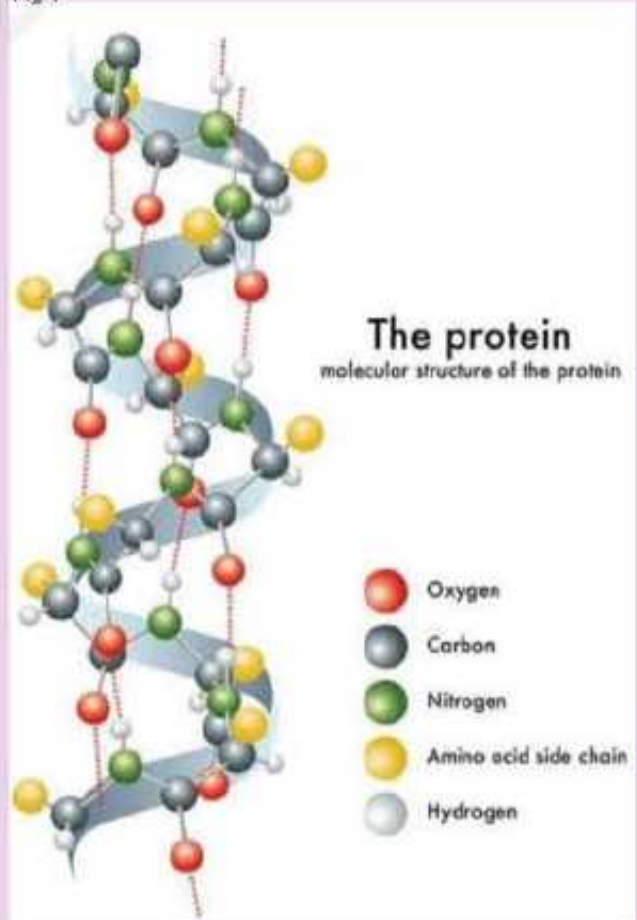

Chemical composition of hair

Hair is composed of many contributing factors: proteins, raw elements amino acids and bonds work together in forming hair fiber the dominant contributor in the composition of hair fiber. The dominant contributor in the composition of hair is protein, accounting for 91 percent of hair fiber. Amino acid, the building block of protein are made up of COHNS elements (carbon, oxygen, hydrogen, nitrogen and sulphur).

The percentage of COHNS elements in hair as follows:

Element	Percentage in normal hair
Carbon	51%
Oxygen	21%
Nitrogen	17%
Hydrogen	6%
Sulphur	5% (Fig 4)

Fig 4

These elements form bonds called side bonds which link together the long chain of amino acids known as the polypeptide chain. This chain forms a helix by creating spiral movement that interlines

Darker hair has more carbon and hydrogen whereas light hair has more oxygen and sulphur.

Hair growth cycle

Objectives : At the end of this lesson you shall be to

- explain hair growth cycle
- define various types of hair
- state hair texture, density, elasticity and porosity.

Hair growth cycle/ life cycle of hair

Every hair has its own rhythm of hair growth. Some hair grows fast and some hair grows slow. Since each hair has its own root, follicle, bulb and papilla. The rate of their growth varies from 2 years. On an average one head has 1 lac to 1.5 lac hair. It depends on the distribution of the roots all over the head.

It is maintained if 100 strands of hair shed everyday, it is normal if it is more than 100. You have to consult a trichologist or physician. It is normal to shed hair since follicle reproduce new hair when its falls down.

Hair growth through four phases of its life cycle (Fig 1)

- 1 **Anagen phase:** The growing phase. The stages of hair growth begin, with the anagen phase. It's the longest phase, lasting about 3 to 5 years for the hair on your head, though for some people a single hair could continue growing for 7 or more years. Fortunately, the anagen phase differs with different types of hair for example, the anagen phase for eyebrow hairs is much shorter than the phase of your scalp.

Hair grows at the rate of 1 cm to 1 1/2 per month 90% of our hair on the head is growing in this stage. Scalp hair grows fast on women then on men. Hair growth influenced by diet, health and hormones. It is the active phase of the hair. The cells in the root of the hair are dividing rapidly.

A new hair is formed and pushes the club hair/ a hair that has stopped growing or is no longer in the anagen phase/ up the follicle and eventually out. During this phase the hair grows about 1 cm every 28 days. During the anagen phase, your hair follicle are pushing out hair that will continue to grow in until they are out or until they reach the end of their lifespan and fall out.

Some people have differently growing their beyond a certain length, because they have short active phase of growth. On the other hand, people with very long hair have a long active phase of growth. The hair on the arms, legs, eyelashes, and eyebrows have a very short active growth rate of about 30 to 45 days, explaining why they are so much shorter than scalp hair.

- 2 **Catagen phase:** Transition phase. The catagen phase starts when the anagen phase ends, and tends to last about 10 days or so. During this chapter, hair follicle shrink and hair growth slows. The hair also separates from the bottom of the hair follicle, yet remains in place during its final days of growing.

Only about 5 % of the hair on your head are in the catagen phase at any given time. IT lasts for one week to six weeks. Hair stops to grow. The hair bulb gradually separates from the papilla and moves up to the follicle and comes out on the surface. Growth stops and the outer root sheath shrinks and attaches to the root of the hair. This is the formation of what is known as a club hair.

- 3 **Telogen:** Resting phase. The telogen phase typically lasts about 3 months. An estimated 10 to 15 percent of your scalp hairs are in this phase. Hairs doesn't grow during the telogen phase, but they don't fall either. The telogen phase is also when new hair start to form in follicles that have just released hairs during the catagen phase.

Lasting till the new hair takes birth in the follicle. All that detached hair comes out. This phase lasts for about 100 days for hairs on the scalp and longer for hairs, on the eyebrows, eyelashes, arm and leg. During this phase, the hair follicle is completely at rest and the club hair is completely formed. Pulling out a hair in this phase will reveal a wild, hard, dry, white material at the root about 25 to 100 telogen hairs are shed normally each day.

Some health experts consider the telogen phase the shedding phase, as well, but many scientists have divided this stage into two parts : The telogen and exogen phase.

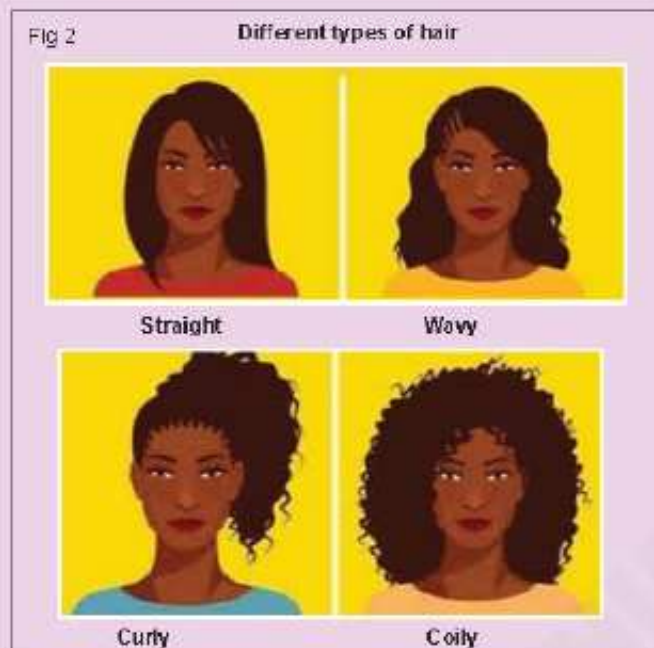

- 4 **Exogen:** Shedding phase. The exogen phase is essentially an extension or a part of the telogen stage of hair growth. During the exogen phase, hair is shed from the scalp, often helped by washing and brushing. Losing 50 to 100 hairs per day during the exogen

phase is normal. During the exogen phase, which can last about 0 to 5 months, new hairs are growing in the follicle as old hairs fall away.

Various type of hair

Everyone's hair is as individual as a finger print. Hair type is determined by a number of genetic factors. Hair varies from person to person in terms of pattern/ shape and oiliness and length

Hair types as per pattern/ shape (Fig 2)

Your hair follicle and hair shaft decide how your hair will look. The tilt of the hair follicle and the way it grows into the scalp decides your hair pattern. The amount of curling is based on your hair follicle shape.

On the basis of shape/ pattern, hair may be classified into four categories

- a **Straight hair** : If your hair falls flat from the roots to the tips, you have straight hair. The hair texture is soft and silky, with no curls straight hair type often has a high amount of oil secretion in this naturally hair type.
- b **Wavy hair**: Wavy hair lies between straight and curly. There is a straight curl pattern at the end of your hair. However, it is not entirely curly. It can hold hair styles very well. Its texture is quite rough, and its diameter is thick.
- c **Curly hair**: Curly hair has an "S" pattern and stays curly irrespective of straightening processes. It is frizzy and prone to tangles. It has higher density or compared to wavy and straight hair.
- d **Coily hair**: Coily hair follows a "Z" pattern. It may seem rough and coarse but is actually quite fragile and soft. It is easily prone to breakage and damage if not taken care. Coily hair are also known as kinky hair and very curly hair. They have very high density with extremely tight curls.

Hair types as per oiliness/ greasiness

Knowing how greasy your hair is can help you understand how frequently you need to wash it. You will also be able to pick the right products, like clarifying shampoos and conditioners.

On the basis of oiliness, hair may be classified into four categories:

- a **Oily/ greasy hair**: It is usually caused by hormonal imbalance during adolescence and menopause. Environmental condition like weather and humidity also contribute to this problem. Greasy hair looks dull, lank and is not amenable to manageable styling. Common causes of oily hair are unhealthy eating habits, medications, improper hair care, stress, hormonal fluctuations and change in weather. It's important to brush your hair even if it is oily because it helps to distribute these oils throughout all your hair rather than letting them to collect in one place. Oily hair needs to be washed 4 to 5 times a week.
- b **Dry hair**: It is usually caused by external factors like – perming, excess heat, bleaching use of strong shampoo, frequent shampooing and faulty diet. Dry hair invariably has split ends and is always coarse in textures. Dry hair develops when your hair doesn't get or retain enough moisture. This reduces its sheen and can make it appear frizzy and dull. Dry hair needs to be washed once or twice a week. (Fig 3)

Fig 3

- c **Normal hair**: It has a healthy natural bounce and sheen. It is neither dry nor greasy it is manageable. The sebum levels are balanced and the sebum naturally protects the hair. Normal hair is generally soft to the touch and easy to detangle. It is easy to style, shiny and non – static. This is the result of a healthy lifestyle (getting enough sleep, exercising, not smoking) a good diet and above all a good genes. Normal hair needs to be washed twice or thrice a week.
- d **Combination hair**: It is very greasy at the scalp and has dry split ends. Often, the hair behind your ears and over the temples secrete a high amount of oil. This hair type can make caring for your hair a little difficult, since, different parts of your hair need different kinds

of attention. If your focus on remaining excess oils, you may end up with even drier ends, which could lead to damage. The trick is to treat both issues, while avoiding trying out the ends further and adding oils to the scalp. Combination hair needs to be shampooed with oily hair. Shampoo few times per week and it is must to apply conditions. On length whenever you wash your hair

Types of hair as per length

Hair is distributed all over the body except on the palms of the hands, soles of the feet, lips and eyelids. Technical terms for hair on the head and face are Barba – face, Capilli – head, Cilia – eyelashes.

On the basis of length, hair can be categorised into two types

- a **Long hair:** It protects the scalp against sun's ray and injury gives adornment to the head and forms a pleasing frame for the face. Soft long hair also grow in the armpits of sexes and on men faces. Male hormones make a man's facial hair coarser than a woman's (Fig 4)

Fig 4

- b **Short or bristly hair:** Such as the eyebrows and eyelashes adds beauty and colour to the face. It also diverts sweat from the eyes and eyelashes protects the eyes from dust particles and light glare. (Fig 5)

Hair texture

Texture is the diameter of an individual hair strand. It can be determined by feel and touch. The diameter/texture of the hair refers to the width of an individual hair strand. This is the most accurate way to determine your hair type. It is not that how many strands you have on your head but refers to the width of each strand, thin texture may be categorised as (Fig 6)

Fig 5

Fig 6

- a **Fine hair:** It is the most fragile hair texture. Touch of fine hair silky and fine. In some cases, the hair strand can be so thin that it is not even visible.
- b **Medium hair:** These hair lies between fine and coarse hair. Medium textured hair is easy to work with and allows you achieve a wide variety of textural effects. Medium hair can keep hairstyles better, look thicker and is more resistant to breaking.
- c **Thick/ coarse hair:** They are rough or wiry in texture coarse texture can cause a challenge any chemical service. Thick or coarse hair has all the three layers- Cortex, cuticle and medulla. Thick hair gives the impression of a fuller head of hair, and it can held a hairstyle will. If you have thick hair texture, your hair is more tolerant to heat, styling, products, hairs dye and breakage than fine or medium hair coarse hair is prone to depress and frizziness.

Hair density

Hair density determines the degree of hair bulb that will be sectioned or the correct parting size of hair to be straightened thin density pertains to how much hair (the number of individual strands) one has on his scalp. One can have their hair with more density and vice versa.

Hair density may be categorised into three parts

- a **Thin density:** If you can easily see your scalp, you have thin hair density. That means your hair is scantily placed. It is when your scalp is plainly visible through your hair.
- b **Medium density:** If you can see your scalp partially from underneath your hair, you have medium hair density. Medium density hair is somewhere in between thin and thick hair. You can see some scalp, but not a lot.
- c **Thick density:** If you can hardly see your scalp, you have thick hair density (Fig 7)

Fig 7

Hair elasticity

Hair elasticity refers to the extent to which a single hair strand can stretch before returning to its normal state. It is a strong indicator of hair health. Hair with high elasticity has a good amount of shine and bounce and is regarded as the strongest of all hair types. Healthy hair when wet, will stretch up to 50% of its original length and returns to its normal shape without breaking while dry hair will only stretch about 20%. (Fig 8)

Fig 8

The wet stretch test

- 1 Gather about 10 strands of hair and spray with water.
- 2 Hold hair firmly with both hands between the thumb and finger.
- 3 Lightly stretch hair away from client's head. If the hair stretches and returns then it is BALANCED, if not, it lacks protein.

Hair elasticity may be categorised into three parts:

- a **High elasticity:** If your hair strand stretches a long way without breaking immediately, it indicates high elasticity. This means stronger hair. Often coarse hair is highly elastic.
- b **Medium elasticity:** If your hair stretches to some extent before breaking, it indicates medium elasticity. Most women have medium hair elasticity. You can strengthen your hair using natural hair masks and hair oils.
- c **Low elasticity:** Hair that snaps almost immediately after stretching has low elasticity.

Hair with normal and high elasticity is easily styled with wet – roller sets, thermal styling, tools etc., while hair with low elasticity may prove hard to curl, or lose its curl quickly.

Porosity

Porosity refers to your hair's ability to absorb and retain moisture. The higher the porosity, the more moisture and product it will absorb. High porosity may cause damage to hair. This also extends to its ability to absorb products. Knowing the porosity of your hair can be helpful in choosing the right products for your hair. Submerge a single hair strand in a cup of water to determine the level of hair porosity.

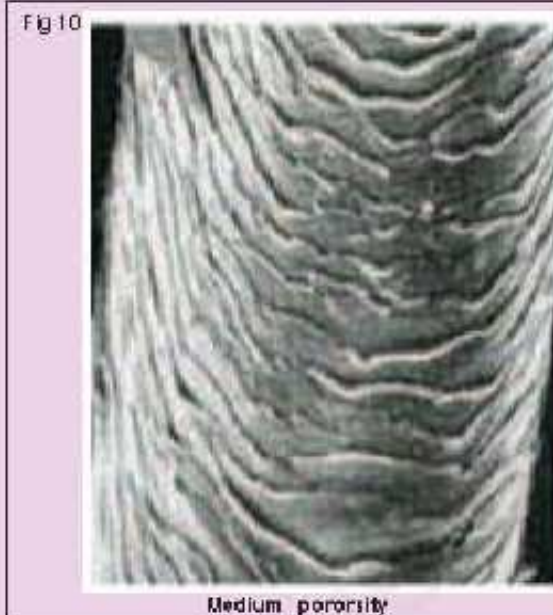

The porosity is of three types:

- a **High porosity:** If the hair strand sinks to the bottom, you have high hair porosity. Hair with high porosity is more prone to damage as it can readily absorb the chemicals from products. It also gets frizzy and rough easily. Your hair may also dry up quickly after you wash it. A high number of pores in the hair cuticle results in high porosity. It is often caused due to frequent application of chemical-filled products or treatments. When you have highly porous hair, it is never hydrated enough. (Fig 9)

- b **Medium or normal porosity:** You can find the strand floating in between the water and rightly balanced if your hair has normal porosity. This hair type takes in the correct amount of moisture. After washing it, your

hair feels wet, but not sticky. It does not require a lot of maintenance and can hold any hairstyle effortlessly. Hair with normal porosity is less prone to damage. (Fig 10)

- c **Low porosity:** If you have low porosity, your hair strand will float on the surface. This means, your hair takes a long time to dry. Your hair cuticles have fewer pores, which minimise your hair's capacity to absorb water. The water tends to remain on the surface of the cuticle and products often get settled on top of your hair rather than sinking in. After a hair wash, your hair stays wet for long hours and feels sticky. (Fig 11)

How to analyse porosity of hair (Fig 12)

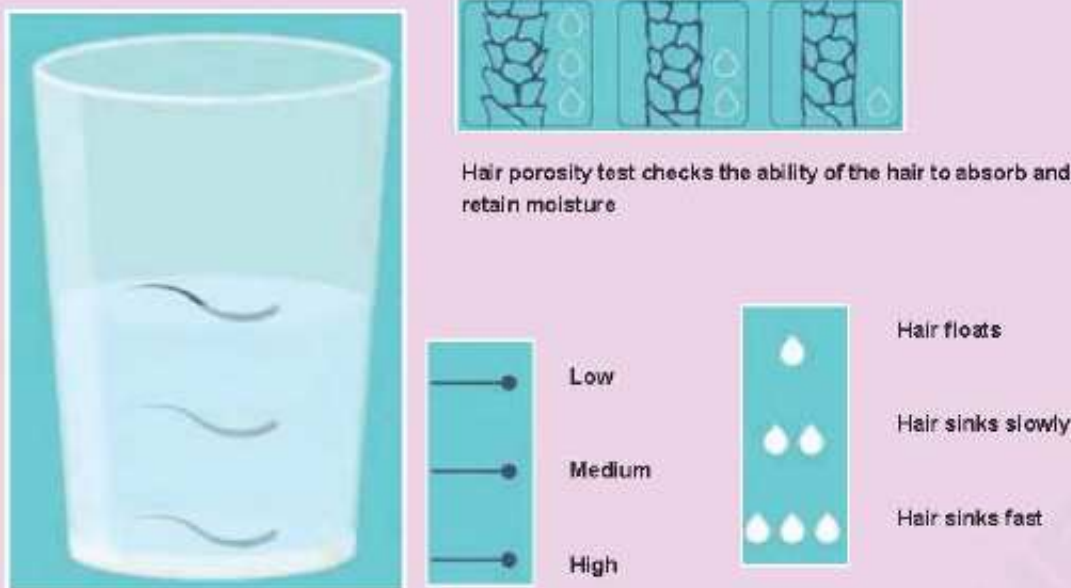

1. Lift up a clean, dry hair strand from the crown area.
2. Hold the ends between the thumb and index finger.
3. With the thumb and index finger of the other hand, lightly rub the strand from the ends down to scalp.

Non porous: Glassy look and feel tight, very slick, feeling cuticle, cortex is intact.

Normal: Shiny without appearing glassy, cuticle is intact and feels smooth.

Porous: Dull looking has a more open cuticle and feels rough.

Fig 12

Head massage

Objectives : At the end of this lesson you shall be to

- state the purpose, product knowledge, procedure, benefits and precautions of
 - hand massage
 - shampooing
 - conditioning
 - deep conditioning.

Head massage (Fig 1)

Fig 1

Good brushing will keep your hair looking its best. But a scalp massage is a must for healthy strong hair. It helps to fasten the flow of blood to the head. A scalp massage everyday will improve circulation and actually help to fight split ends. You may use the pads of your fingertips or a rubber scalp massage for scalp massage.

Purpose of head massage

A head massage may help relieve stress and reduce tension. It may also ease migraine or headache pain, lower blood pressure, improve circulation to your head and neck, and promote hair growth.

Good brushing will keep your hair looking its best. But a scalp massage is a must for healthy strong hair. It helps to fasten the flow of blood to the head. A scalp massage everyday will improve circulation and actually help to fight split ends. You may use the pads of your fingertips or a rubber scalp massage for scalp massage.

Product knowledge for head massage

- Oil
- Cotton
- Towels
- Caps
- Shampoo
- Conditioner
- Oil heater
- Gown
- Comb

Procedure for head massage

- 1 Before putting oil, give pressure on ears and on the scalp.
- 2 Apply warm oil on the scalp and do stretching strokes from forehead to the neck
- 3 Then rotation movements clockwise and anticlockwise.

- 4 Give pressure on the centre of the head (press and release)
- 5 Give pressure starting from the eyebrows
- 6 Circular movement on the head and squash at the back.
- 7 Pinching on the scalp
- 8 Massage clockwise and anticlockwise on the ear lobes and then give pressure on the ears (press and release)
- 9 Give circular movements and then down the neck 10 Give circular movements and then down the neck 11 Massage the neck and shoulders
- 12 Last give pressure between the spinal bones
- 13 Go up and give pressure on the shoulders and arms. Then give patting movements on the shoulders and back.
- 14 Finish the massage with slow relaxing movements massage should be for maximum 20 minutes.

Precautions for head massage

- 1 Oil should be lukewarm. It should neither be too hot nor too cold.
- 2 Drape client properly.
- 3 Do not give very hard massage to your client
- 4 Always use oil as per client's hair type.

Shampooing : Shampooing is the ideal way to remove dirt and oil from your hair. It also cleans the scalp from all gels, sprayer and smoke. A good shampoo is one that does not interfere with the scalp's natural oil secretion. Shampooing cannot repair or change the process of overactive oil glands. Contrary to legend, washing does not dry out hair. You should shampoo your hair as often as needed. Shampooing is an important procedure of cleaning both the hair and scalp, this is essential in preparing the hair for other services. If any deposits remain in the hair after shampooing, they may interfere with the service you are carrying out e.g. They would block perm, chemicals or leave the hair too greasy to make style. (Fig 2)

Fig 2

Purpose of shampoo : The main purpose of shampoo is to remove dirt and oil from the surface of the hair fibres and the scalp, while the main purpose of conditioner is to ensure

that the hair is smooth for combing. Some commercial shampoo may also have additional components to control dandruff and condition hair.

Product knowledge

Good shampooing can be both physically and psychologically soothing, relaxing and enjoyable. Make sure your client is comfortable throughout. Poor shampooing technique may irritate your client and lead to general dissatisfaction. (Fig 3)

Fig 3

Choosing a shampoo

Shampoo comes in various forms (the bulk of the shampoo) and some are gentler on hair and skin than others. The balance of various shampoo ingredients is important e.g. the detergent content in shampoo for greasy hair is higher than in those for normal or dry hair. Choosing the right shampoo for the hair condition and following service is important. If the wrong shampoo is used, the hair could become difficult to handle, fly away, static, feel dry and brittle or look dull.

Different types of shampoos

There are shampoos for normal, dry or oily hair. There are also shampoos for specific types of hair texture, and products for color-treated hair. These are the most popular types of shampoos: Clarifying, color-protecting, moisturizing and shampoos.

Requirement (Fig 4)

Fig 4

- Consultation form
- Towel
- Shampoo
- Conditioner
- Wide toothed comb
- Flat brush
- Vent brush
- Hand dryer
- Attachments
- Diffuser
- Styling product

Procedure of doing shampoo

- 1 Drape client
 - 2 Examine hair and scalp (abrasions, dermatitis, lice)
 - 3 Brush hair and scalp to loosen dirt and hairspray (Never brush prior to a chemical service)
 - 4 Seat client at shampoo chair and place cape behind chair.
 - 5 Let hair thoroughly
 - 6 Apply shampoo evenly on scalp and hair
 - 7 Massage the scalp with fingertips using steady circular motions
 - 8 Rinse hair thoroughly
 - 9 Repeat steps 6 to 8.
 - 10 Apply cream rinse or conditioner and rinse well
 - 11 Squeeze out excess water and towel dry
 - 12 Wipe sink and chair for next client
 - 13 Client is now ready for next service
- Benefits of shampoo**
- It helps to improve the condition of hair so that it feels better to touch.
 - Shampoo help to remove dirt debris, order, sweat oil.
 - They improve the looks feel of hair scalp.
 - They have moisturizing effect.

Safety precautions

- Never use finger nails
- Clean up spilled immediately
- Always keep a close check on water temperature
- Do not permit shampoo to get into client's eyes
- Protect water from entering client's ears.

Conditioning and deep conditioning

Conditioning add brilliance to all types of hair, especially dry hair can benefit to get a luminous shine. Natural oil secreted by the scalp help to keep hair glossy, sometimes. These oil gland may not produce enough oil or either

factors affect it. All types of hair require conditioning. The nature and condition of your hair is determined by the level of moisture it retains conditioners help hair that has been exposed to poor bleaching over time, faulty diet and excess sunlight conditioners help to bind moisture and keep the hair smooth and soft. It assists in removing tangles and makes the hair easier to manage and style conditioning treatment is essential at least thrice in a week in order to maintain the oil and moisture balance. It restores natural bounce and shine to your hair long hair is vulnerable, as the natural oil does not reach and causing split ends. (Fig 5)

Fig 5

The use of conditioner rectifies this condition

Greasy hair requires a conditioner of light consistency and must be used sparingly.

Dry hair calls for protein conditioner split end can also be sealed by the use of protein conditioner. Which enriches your hair.

Normal hair needs conditioning too conditioners bring out the beauty and gleam of your hair.

Purpose – conditioner decreases the frizz, and detangle. The hair, which therefore reduce breakage, splits-ends and damage.

Product knowledge

- Things required
- Consultation form
- Treatment product
- Bowl
- Cotton
- Crown
- Towels
- Cape
- Spatula
- Tissue box
- Hair steamer
- Shampoo
- Conditioner

- Big toothed comb

Procedure

It is very important to apply treatment product properly.
Condition after shampooing

Shampoo the hair according to its type

Squeeze the excess water off the hair or use a towel to dry it.

Take a treatment product

Re-concentrate are protein-based and make the hair stronger. Use them if your hair is chemically treated or weak. (Fig 6)

Fig 6

Do not pour conditioner directly onto your hair. Take a treatment product on palm of your hand and sub them together.

Once in lather, apply to your hair

Gently move your fingers through the hair to spread it evenly from root to tip.

If your hair is long use a wide tooth comb to distribute the conditioner evenly.

Never use your nails or dig into your scalp

Leave on for 60 seconds, giving your hair time to absorb the nutrients

Note some products require massage on hair and scalp and some are not read manufacture instruction clearly.

Give steam using a hooded dryer for 10-15 minutes or wrap a hot towel.

Let it cool for few minutes

Rinse thoroughly with luke warm water use cold water for the last 20 seconds.

Remove the towel from the client's shoulders.

Escort client to the reception and inform GRF about the service.

Wish client and come back to clear the work station and prepare for next appointment.

Benefits of conditioning

- 1 Conditioner protect hair it does not lose its natural condition, or help chemically treated hair to maintain or improve its condition.
- 2 The hair cuticle is smoothed.
- 3 Hair tangling is reduced.
- 4 Broken areas of the cuticle or cortex may be repaired.
- 5 The hair surface reflects more light, producing a gloss or sheen.
- 6 Surface acidity/alkaline is balanced.

Precautions

- 1 Shampoo first, only if necessary
- 2 Always use conditioner based on your hair type
- 3 Comb throughout with your fingers.
- 4 Always rinse with cool water.
- 5 If your client is acne prone, be sure to keep freshly conditioned hair away from your face.

Common hair problems

Objectives : At the end of this lesson you shall be to

- explain the following
 - dandruff
 - hair falling
 - conditioning
 - split ends
 - pediculis
 - grey hair
 - dry and chemically damaged hair.

Introduction of dandruff

Dandruff is white flaky skin like a matter on our skin. Trichologists claim dandruff to be a natural shedding of skin, which is not removed because of the hair. If washed regularly, these will disappear while others say that dandruff is an infectious disease because of infection

they occur. In technical terms it is known as "PITYRIASIS" – the loss of small flakes of skin from an otherwise normal scalp. It is a fungal infection caused by a microorganism called *Malassezia* spores. Human skin cells are forever renewing themselves. As skin cells in the scalp are removed, the old (dead) ones are pushed to the surface and then out of the scalp. However, in some cases, the

new cells are produced at a faster rate than at which they die resulting in more skin being shed causing.

Invisible flakes called dandruff

It is a common condition that causes the skin on the scalp to flake. But it can be embarrassing and difficult to treat. Mild dandruff can be treated with a gentle daily shampoo. If that doesn't work, medicated shampoos may help. Symptoms may return later.

Symptoms

- Skin flakes on your scalp
- Itchy skin
- The signs and symptoms may be more severe if your scalp is dry and they tend to flare in dry seasons.

Causes

- Irritated, dry skin
- Not shampooing enough
- A yeast-like fungus that feeds on oil on the scalp of most adults
- Dry skin
- Sensitivity to hair care product

Types of dandruff

- 1 **Dry dandruff (Fig 1):** It is pityriasis capitis simplex. In dry dandruff, small particles of flaky skin come out on clothes and shoulders. Causes of dry dandruff are irregular blood supply, emotional stress, and dirty scalp.

Fig 1

- 2 **Oily dandruff (Fig 2):** It is pityriasis steatoides. In oily dandruff, the flaky skin sticks to the scalp because it contains sebum. It is very contagious and itchy. If this skin ruptures, bleeding might occur. One needs to visit a doctor in such a case.

Treatment

The itching and flaking of dandruff can almost always be controlled. For mild dandruff, first try daily cleaning with a gentle shampoo to reduce oil and skin cell buildup. If that doesn't help, try a medicated dandruff shampoo. You may need to try more than one shampoo to find the

hair care routine that works for you. And you'll likely need repeated or long-term treatment. Gently use a comb or hair brush to remove loose scales or flakes and then wash with a medicated shampoo. Take care not to remove patches or plaques too aggressively as this would irritate the condition.

Fig 2

Hair fall

Hair falling is also known as alopecia or baldness. In the dermis, the hair follicle is surrounded by collagen fibers which give elasticity and keep the follicle supple. Due to different reasons, the collagen fibers lose their elasticity. This results in the redefining of the follicle, hence the hair growth is restricted. The hair becomes thinner and stops growing. (Fig 3)

Fig 3

Alopecia

A vast subject in itself. This is a general term for baldness. Extensive study has been conducted on it. Many types of alopecia have been found. Some types of baldness are permanent, some are temporary.

Alopecia areata – It appears on the scalp as a small bald patch having no hair. Smooth, shiny skin appears. Eventually, they join up to form larger bald patches. These patches may appear overnight, so you may get horrified in the morning to see a bunch of hair on your pillow. The hair surrounding these patches may have short protruding hairs with frayed points. These hairs are present where the area of the baldness is still increasing.

The cause of alopecia areata is still to be discovered. The researches have attributed the causes as hereditary

stress, amenity, tension, shock, worry etc. In alopecia areata, the falling hair are in anagen. These leaves the scalp bald during the period of catagen and telogen phases of growth cycle. Hair will regrow in the next anagen researchers have found it to be an auto-immune disease, where the body has a faulty immune system which affect its root cell.

Alopecia totalis is the complete loss of scalp hair combined with the loss of eyelashes the beard, moustache and body hair may lose too. Regrowth is rare once the condition is established, so medical help should be sought as quickly as possible.

The alopecia universalis is a condition of such nature. Take immediate medical help or see a beauty therapist. Androgenic alopecia is the most common type of baldness and most men will have it to a greater or lesser severity at some time. It can start in the later teens, in middle or in old age. The hair line recedes & there is loss from the crown until the whole vertex is denuded of hair. This may develop over a few or many years.

There is a reduction in the length of time anagen lasts, the hair become gradually shorter and thinner. Eventually the hair do not regrow and the follicle either remain hairless or is taken over by a fine vellus hair. These give nothing like an adequate covering and the scalp is bald. Male pattern baldness has a definite genetic link parents inflict both the severity and the age of onset of the baldness on their unfortunate male children too much of male hormone present in the person hair loss. Therefore women are less affected by this type of alopecia increasing age causes this alopecia after menopause androgenic alopecia develops in some women too. Diffuse alopecia is a gradual loss of hair fall over the scalp.

This is not associated with itching or scaling. It occurs in female for a variety of seasons. Give treatment in your parlor with the treatment prescribed for alopecia areata change the diet of the client too. First it is necessary to know the probable cause to treat it telogen effluvium (molting) following child birthing high fever or severe emotional stress many scalp follicles enter catagen simultaneously, causing thinning of scalp hair. These should be regrowth within a few months if proper care and diet is taken under activity of thyroid or pituitary glands.

This will decrease the rate at which, the body uses energy (Basal metabolic rate) and may be due to a tumour or more rarely a lack of iodine in the diet. Iron deficiency you don't have to be anemic. It could be linked to the menstrual cycle. Tiredness is often a symptom. Try to eat iron or take iron tablets if vegetarian. The side-effects of drugs. Drugs such as contraceptive tablets, or anti-mitotic tablets for cancer patient.

This slows down the cell division in healthy cells such as the hair drugs like antibiotics come – times causes this hair loss. Severe illness such as cancer, kidney or liver failure during pregnancy, women take more nutritious diet like vitamin A for the good of their unborn children. After birth they are seen taking less of vitamin A. These cause vitamin A deficiency or other minerals in body. The hair fall increases in these case.

Causes (Fig 4)

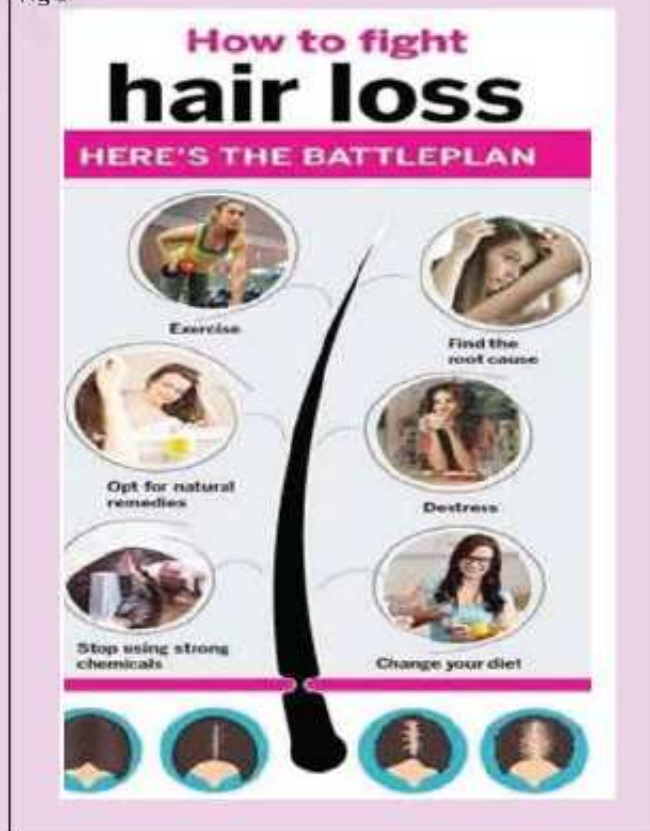

Fig 4

- 1 Lack of protein and iron
- 2 Hereditary
- 3 Stress
- 4 Excessive use of heat stylers
- 5 Strong intake of antibiotics
- 6 Hormonal imbalance
- 7 Aging

Treatment (Fig 5)

Fig 5

- 1 Take a balanced diet
- 2 Take relaxing massage
- 3 Use aloe vera or hair and scalp
- 4 Use coconut oil / olive fish / fische oil
- 5 Use onion juice
- 6 Take multivitamins
- 7 Regular hair wash
- 8 Laser therapy
- 9 Yoga
- 10 You may take treatment from trichologist

Split ends (Fig 6)

Fig 6

Introduction

Split ends are exactly what they sound like. They occur when the hair shaft splits from a single strand to multiple, usually occurring at the tip. This is typically a sign of damaged or unhealthy hair. Split ends occur in response to excessive or repeated chemical treatments, grooming habits, and various environmental exposures. These can result in progressive damage to the hair, seen as "weathering". This is when the hair becomes frizzy, and tangled, making it difficult to maintain after repeated exposures, the outer protective layer of the hair, the cuticle, no longer maintains its protective function. The loss of this layer renders the rest of the hair strand more susceptible to subsequent damage and breakage, resulting in the appearance of split ends.

There are five types of split ends – the basic split, the fork split, the tree split, the feather split, the knot (Figs 7 & 8).

Causes

There are various environmental causes eg. Harsh winds and pollution, heat, physical damage, chemical and colour treatment, ultraviolet damage, genetic causes, nutritional damage, over washing, forcefully combing or brushing your hair, strain and friction, lack of regular hydration, irregular trimming and usage of hard water.

Fig 7

Fig 8

Basic split

Tree split

knot split

Treatment of split ends

- Identify and avoid triggers that commonly cause split ends.
- Avoid excessive and aggressive brushing and combing of both wet and dry hair.
- Limit excess applied heat to the hair
- Decrease the frequency of chemically applied hair treatments
- Ensure proper daily nutrient requirements
- Use moisturizing oil treatments to preserve the cuticle layer
- Maintain hair health by getting trims several times a year
- Protect hair from UV sun exposure.
- Hydrate your hair
- Use a hair mask
- Add time between hair treatments

Pediculosis (head lice) is also called scalp infestation or hair infestation. The most common infestation is lice and nits. Louse is an insect that is found in hair, and human scalp. It is a small insect that causes a lot of irritation and may cause skin infections too. (Fig 9)

They suck human blood therefore, heavy infestation may lead to lack of blood and severe weakness. Lice is found in about 62% of Indian population- more among the rural populations. The females are more infested than males. In urban areas lice infestation is more common among the school going children the lice facts-

Fig 9

A common louse is about 2mm in length, have six legs small head, big body-almost stomach.

Lice changes colour according to hair colour

Lice lays eggs, very fast. One louse lays at an average 8 eggs in a night.

Lice can move very fast (Fig 10)

Fig 10

The louse egg is known as nit. It has a sticky edge which is stuck to the hair. The live nit is plump and makes a sound if cracked. It takes hours to hatch.

Lice lone short, clean hair more than long, dirty hair.

Lice in ways are mostly found on the top, and in girls behind the ears.

Lice can not jump but can move very fast, does infesting head after head very fast.

Lice can become super lice making it immune to chemicals.

Causes

Anyone may become louse infested under suitable conditions of exposure. Pediculosis is easily transmitted from person to person during direct contact head lice infestations are frequently found in school settings or institutions crab lice infestations can be found among sexually active individuals. Body lice infestation can be found in people living in crowded unsanitary conditions where clothing is frequently changed or laundered. For both head lice and body lice can occur during direct contact with an infested individual. Sharing of clothing

and comb or brushes may also result in transmission of these insects. While other means are possible, crab lice are most often transmitted through sexual contact.

Symptoms

- Extreme scalp itchiness
- Feeling like something is crawling on your scalp
- Sores and scabs on your scalp from scratching
- Visible lice on scalp
- Lice eggs on hair shaft

Prevention/treatment

Medicated shampoos or cream rinses containing pyrethrums or permethrium are preferred for treating people with head lice. Products containing pyrethrum or marathon are available over – the – counter, but those containing lindene or malathion are available through a physician's prescription lindane - based shampoos are not recommended for infants, young children, pregnant, women, lactating women, the elderly, persons with HIV or seizure disorders, persons who have very irritated skin or sores where the lindane will be applied and person who weightless than 110 pounds retreatment after 7 to 10 days is often recommended to ensure that no eggs have survived nit combs, are available to help remove nits from hair. Dose and duration of shampoo treatment should be followed carefully according to labeled instructions over-the – counter (OTC) or prescription medications are used to treat the affected people and their families

Follow these treatment step (treatment procedure)

- 1 Remove all clothing
- 2 Apply lice – killing medicine, also called pediculicide, according to the label instructions. If a child has extra-long hair, one may need to use a second bottle.
- Warning:** Do not use a cream rinse or combination shampoo/conditioner before using lice medicine. Do not rewash hair for one to two days after treatment.
- 3 Have the infested person put on clean clothing after treatment.
- 4 If some live lice are still found 8 to 12 hours after treatment, but are moving more slowly than before, do not retreat. Comb dead remaining live lice out of the hair using a fine – toothed comb (lice comb). The medicine sometimes takes , longer to kill the lice.
- 5 If no dead lice are found and lice seem as active as before eight to twelve hours after treatment, the medicine may not be working. See a health care professional for a different medication and follow their treatment instructions.
- 6 Nit (head lice egg) combs, often found in lice medicine packages, should be used to remove nits and lice from the hair shaft. Many flea combs made for cats and dogs are also effective.
- 7 After the initial treatment, check, comb and remove nits and lice from hair every two to three days.

8. Retreat in seven to 10 days.
9. Check all treated people for two to three weeks until you are sure all live and nits are gone.

Grey hair

Grey hair is another common problem. It is a natural problem. The hair contains pigment cells known as pigment melanin. These melanins are composed of sulphur, carbon, hydrogen and oxygen. These compose together in different proportions to give different colours to hair like black, brown, red, blond etc. while the westerners have red to blonde hair.

This is due to different proportion of carbon, oxygen, hydrogen and sulphur. These pigment melanin get damaged when become old. The production of new pigment melanin cells ceases too.

Then hair becomes transparent or white. Actually there is no grey hair. When white hair mixes with dark colour hair, it gives the illusion of grey hair. Sometimes because of illness like typhoid, malaria, chicken pox, cholera, etc. high blood pressure, heart disease, effect, pollution, anxiety, shock, stress, tension, lack of care, lack of nutrition, can damage the pigment melanin.

Due to this untimely damage, the hair becomes white. Once a hair becomes white, it is not possible to turn it into its original colour by reliving the pigment melanin. Till now no treatment, drug or oil has been going in this matter, and no treatment has been made. You may often see advertisements with high claims but do not go after it.

There have been enough cases which even have caused damage to skin, scalp and hair. Try to save the remaining coloured hair. Use of chemical dyes cover up the whole lot of hair. The sun rays and other natural elements are blocked. This kills the remaining pigment melanin, creating more white hair. This some times even turn the hair of eyebrows, eyelashes and body into white hair. (Fig 11)

Fig 11

Instead go for the natural colorants like – henna, hibiscus, marigold, rhubarb, etc. Even amla can be used as natural dye for black-brown hair. Take lot of green leafy vegetables, zinc, protein, vitamins, water avoid alcohol, smoking. Avoid late nights, tension, anxiety. Go for meditation and exercise.

Your hair grows through a natural cycle of dying and then being regenerated. As your hair follicles age, they produce less colour. Although your genetics will determine the actual start of graying once you're 35 years old, your aging hair follicles are likely to produce a white or grey hair to replace the last hair that died. While some people celebrate grey hair as a sign of maturity and wisdom, many feel that they look older when their hair starts growing gray and would like the gray to go away for a more youthful appearance. As we get older, the pigment cells in our hair follicles gradually die. When there are fewer pigment cells in a hair follicle, that strand of hair will no longer contain as much melanin and will become a more transparent color like- gray, silver or white as it grows.

Causes

- Genetics
- Stress
- Auto immune disease
- Thyroid disorder
- Vitamin B-12 deficiency
- Smoking
- Usage of chemical hair dyes and hair products.

Treatment

- Get enough vitamins and mineral
- Eat more antioxidants
- Stop smoking
- Protect your hair from the sun
- Don't use bleach on your hair
- Take less stress
- Apply hair colour on henna on your grey hair dry and chemically damaged hair (Fig 12)

Fig 12

Damage hair

Extremely damaged hair develops crack in the outside layer (cuticle). Once the vertical lifts (opens) your hair is at risk for further damage and breakage. It may also look dull or frizzy and be difficult to manage. Hair damage is permanent because hair is actually a collection of dead cells, making them beyond repair. The only real cure is

time, a part of sheart, and taking step to prevent mens damage. But don't despair with proper hair care and a few targeted treatments, you can help restore the cuter cuticle and begin to improve the look and feel of your hair damaged hair is easily tangled.

The raised cuticles: The lack of moisture on each strand can also add to your knotty situation damaged hair often lack the natural oil and moisture that coats the outside of the cuticle without this, hair loses its shine Fizzy hair is a sign that your cuticle isn't lying flat. It can also mean that the inner fibers of your hair are exposed. Brittle hair can feel like show and break off easily. Its one of the most difficult symptoms to manage and it frequently occur in overly processed hair.

Damaged hair is caused due to over exposure of hair to harsh elements like sun, wind seawater, chemical water, blow drying, colouring, perming, chemicals shampoo etc. Lack of conditioning make the hair to suffer serve damage. This leads to rough textured hair split ends, breakage, hair fall, dry hair, only scalp with dry hair. The hair become tangled and uncountable. (Fig 13)

Fig 13

Types of damaged hair

- Rough texture
- Dull and under nourished
- Dry hair
- Excessive hair breakage
- Chemically damaged hair
- Hair with high porosity and lack of elasticity
- Tangled hair
- Dehydrated hair
- Frizzy hair

Causes

- Excessive use of hair dyes
- After chemical service hair become damage
- Excessive use of bleach
- Usage of excessive heat (Styling tools)
- More exposure to UV rays
- Hair exposed to chlorine water
- Taking more stress

Treatment

- Follow hair care practice
- Avoid brushing wet hair
- Get regular training
- Take anti oxidant diet (Fig 14)

Fig 14

5 deep conditioning hair mask for dry, frizzy and damaged hair

Avocado hair mask

- egg yolk
- avocado
- castor oil

Aloevera hair mask

- aloevera gel
- honey
- castor oil

Coconut hair mask

- coconut oil
- honey
- yogurt

Egg hair mask

- egg yolk
- Olive oil
- honey
- yogurt

Sunflower oil hair mask

- egg yolk
- Sunflower oil
- yogurt

- Avoid washing your hair every day
- Drink as much water as you can
- Brush your hair slowly
- Use protective serum before using heat on hair
- Wrap your hair instead of air drying or blow drying
- Cut down heat styling
- Try colder shower, don't use very hot water on hair
- Use essential oil and healthy oil for head massage
- Wear a hat or scarf while going outside
- Increase intake of vitamins, minerals and omega-3 in your diet.

How to repair damages hair

- Seek professional help if it gets out of hand.
- Cut junk food out of your diet.
- Get regular hair trims.
- Hydrate and moisture your hair.
- Avoid excessive shampoo and styling.

Hair cutting & blow dry

Objectives : At the end of this lesson you shall be to

- identify the facial shape
- explain the sectioning & elevation
- identify the tools use for hair cutting
- describe the hair cutting technique
- describe the basics of blow drying
- identify precautions while doing hair cut.

Scan the QR Code to view
the video for this exercise

Identify the facial shape

The principles of modern hair shaping can be obtained through properly analyzed the client features. The key to success in hair cut is to highlight client's best features (Positive) and cover the worst features (negative).

Haircutting/ hair shaping - is the process of cutting, tapering, texturizing and thinning using any hair cutting tools in order to create a shape. Before learning about hair cutting, it's important to know all about face shapes.

The 7 basic face shapes which are as follows:

Oval: The oval face shape is longer than wide, with a jaw that is narrower than the cheekbones. Because the oval shaped face is so proportional, this face shape looks good with about any hair cut. Any length of cut looks great! Add layers near the cheekbones, lips, or chin to accentuate that feature. (Fig 1)

Fig 1

Round : The round face shape is characterized by a wide hairline and fullness below the cheekbones. These face shapes look great with longer hair that lengthens the face. Long layers are the most flattering for this face shape, where short layers can accentuate the roundness of the face. Side swept bangs can also add length to a round face. (Fig 2)

Fig 2

Square: The square face shape is characterized by a wide hairline and jawline. The square shaped face need height on top and narrowness at the sides. Deep side parts, texture, and soft bangs helps balance the square face shape. Longer length looks great with their more angular and powerful jawline. This face shape should avoid straight lines. (Fig 3)

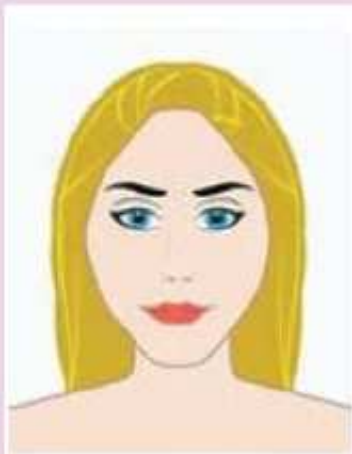

Diamond: The diamond face shape is characterized by a narrow chin and forehead with wide cheekbones. Hair cut

that work best with this face shape have narrower sides and fullness at the chin. A bob is a great haircut for this face shape. This face shape can also add straight bangs to shorten the face. Also try tucking your hair behind your ears to accentuate your prominent cheekbones. (Fig 3)

Fig 3

Fig 4

Heart: The shape of this face is characterized by a wide forehead and narrow chin. Adding side swept bangs to this face shape helps hide the width of the forehead. Keeping the hair around the jawline fuller, can help to put weight on the narrow chin. (Fig 5)

Fig 5

Pear: The pear face shape, which is also sometimes called a triangular face, is characterized by a small or narrow forehead and a larger jaw line. Longer cut can help disguise the prominence of the jaw line. When considering a shorter hair cut add volume to the top in order to add fullness to the top of the face. (Fig 6)

Fig 6

Oblong: This face shape is characterized by a very long and narrow bone structure. Longer hair pulls the face down making it appear even longer. For an oblong face add shorter layers. Adding curls and body can make the face appear wider as well. (Fig 7)

Fig 7

Explain the sectioning & elevation (Fig 8)

Fig 8

The most important purpose of sectioning for a haircut is to determine the actual size of the head. Sectioning is very important because it determines the distribution of hair to the top, the two sides, the crown, and the nape.

Sectioning is done so that, one will understand why all haircuts require sectioning, based on the bone structure of the individual head. Depending on the cut/style one wants to achieve, the angles of the cut will vary in direction within the various sections.

Sectioning for the top

To decide the width of the frontal bone, place the fingers at the center part of the top of the head. Now take finger down the side of head toward the ears. After determining the width, make two partings going toward the hairline and ending at a point.

Sectioning for the crown

Behind the top section and between the parietal ridges on either side of the head, there is slight outline of the crown extend down to the base of the skull.

Sectioning for the nape

With the crown section of the hair clipped up out of the way, One can find the width of the nape section by placing the fingers behind the ears and feeling for the ridge of the temporal bones. By using these bones as the guide, you will have the exact amount of hair at the nape.

Sectioning for the sides

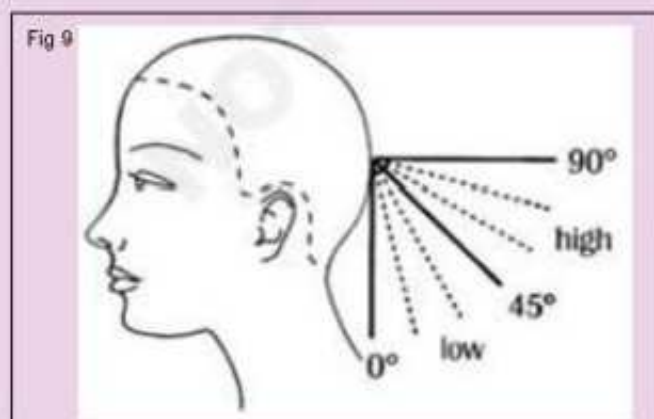

After the top, crown, and nape have been sectioned off, the sides have been outlined. Now see the division between the top section, the crown section, and the nape section. Hair partings within the section are determined by the type of haircut to be given.

For a layered haircut, vertical parting is used within the sections.

For a one-length cut, horizontal partings are used.

The angle used for each of the partings will vary depending upon the cut/style. The sides and the nape section are parted in the same manner.

Elevation (Fig 9)

Elevation is the angle from the client's scalp at which you raise the hair when cutting. Elevation creates graduation and layers and is usually described in degree. The

elevation determines whether the hair is cut one-length (no elevation), graduated (1° to 89°), or layered (90° and more, but usually at 90°). The most commonly used elevation is 45 and 90 degrees. A general rule of hair cut is, the more you elevate the hair, the more graduation you create. When you elevate the hair below 90 degree, you are building weight. When you elevate the hair at 90 degree or higher, you begin to remove weight, or layer the hair.

Elevation define into three categories

- 1 Low elevation:** The hair from the bottom third of the nape section is held at its lowest point, close to the neck. There is no elevation to the hair. The purpose of the low elevation is to produce maximum bulk. This elevation is most effective when the hair is fine and thin.
- 2 Medium elevation:** the hair lifted straight out from where it grows, and the fingers remain parallel to the head. The shears must follow the angle of the fingers. This cut gives you a perfect width of layered ends. A medium elevation can be used on blend hair.
- 3 High elevation:** Hair that is lifted to the top of its section result in the highest elevation High elevation creates layers. A high elevation should be used on medium or thick hair, never on fine or thin hair.

Length

Length is the distance from the scalp to the ends of the hair. Hair length is most often measured (in centimeters or inches) from the line of the scalp on the forehead up over the highest point of the skull to its termination, and sometimes from the crown, the latter resulting in 10 centimeter lower values in average.

Perimeters

The perimeter is the outside design created by the hair when it falls into gravity. You could think of it as the skeleton of the haircut that supports the inside structure.

There are three parts to the perimeter

Back perimeter: Found when all the hair in the nape and crown area is combed down.

Side perimeter: Found when all of the hair from the side and top of the head is combed into gravity.

Front perimeter: Found by combing down the hair in the front hairline. If the front perimeter is above the bridge of the nose, it is sometimes called "bangs" or "fringe."

Angles (Fig 10)

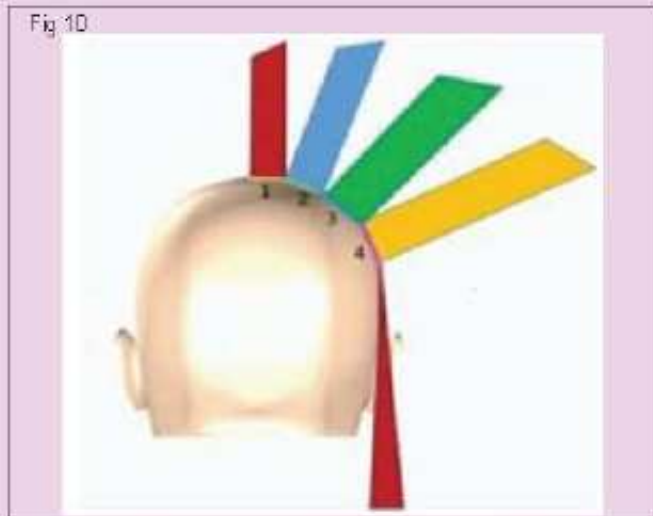

Angles are most important elements in creating a strong base in hair cutting. This is a basic calculation.

Angles are particularly important in two examples: elevation and cutting line.

Lines

A line a thin continuous mark used as a guide. Two basic lines are used in hair cutting-Straight and curved.

Fig 10

Three types of straight lines are commonly use in hair cutting.

- Horizontal
- Vertical
- Diagonal

Cutting line

Cutting line is known as finger angle, finger position, cutting position, and shears angle. This angle creates the end result of hair cut.

Guide line

The guideline is the most important part of a haircut. The guideline determines the finished length of the cut and the overall shape and balance. Guidelines are the first cuts of the hair cut/style.

The guide line is a section of hair that determines the length of hair will be cut.

There are 2 guide lines for a hair cut/style:

- **Stationary Guide** - A stationary guide is a point to which all the hair is directed before cutting. A stationary guide is used in long layered haircuts like the shag. This guide does not move during the haircut.
- **Traveling Guide** - A traveling guide is one that moves with the area being cut. With a traveling guide, hair that has been previously cut is used to indicate the length of the next area to be cut. Haircuts like the basic circle cut and the pixie cut use a traveling guide. The result is layers with a uniform length.

Identify the tools use for hair cutting Tools use in hair cutting

- **Scissors or Shears:** It is an instrument for cutting hair. With the help of barber scissors, hair can be cut shorter. It is available in many sizes, weights and quality of steel. It has two blades, a still and a mobile blade. The ring of finger brace in which thumb is inserted is the mobile blade and the brace in which finger is inserted is the still blade. (Fig 11)
- **Thinning Shears or Scissors:** As clear from its name, it is used to reduce the thickness of hair. In this type

of shears there are notches in the blade which help in thinning the hair. In some thinning scissor there are notches on both blades and while in some, notches are only on one blade. The blades of these scissors have approximately 30-40 notches. When notched on one blade, it help to remove a larger bulk of hair. For fine thinning, scissors with notches on both blades is preferred. During use the hair is caught and held between the spaces of the teeth on notches and cannot be cut resulting in fine thinning of hair. (Fig 12)

Fig 11

Fig 12

- **Razor:** Razor cannot be used for cutting or cleaning all types of hair because this instrument for cutting is only used in salons to clean curly coarse hair. It is used for styling and shaping the hair in cuts like the shag cut and boy cut. In razor the blade cuts the hair hence the blade has to be changed from time to time. (Fig 13)

Fig 13

- **Clipper:** Clippers are mainly used for removing unwanted hair from the neck, such as in crew cut and boy cut. (Fig 14)

Fig 14

Clippers are of two types

- 1 Electric clipper
- 2 Manual clipper

Like the thinning scissors there are notches in clippers. They need to be oiled regularly. The hand or manual clippers requires manual force, while an electric clipper is operated electrically. Thus the electric clipper uses less time as compared to a manual clipper.

Hair Shaping Combs

Tail Comb: It is also known as a Rattail comb. With help of a tail comb the hair can be sectioned easily. It is used while styling and while working on sections. Some types of tail combs are listed below: (Fig 15)

Fig 15

- 1 Close teeth comb
- 2 Wide teeth comb
- 3 Pin tail comb

- **Barber comb or cutting comb:** Is used for cutting hair from the nape of neck area mainly in men's hair. In this comb there are close teeth on one end and wide teeth on other end. (Fig 16)
- **Wide-tooth comb:** Mainly used to detangle hair. Rarely used when performing a haircut. (Fig 17)
- **Styling or cutting comb:** Also referred to as purpose comb, used for most haircutting procedures. It can be 6 to 8 inches in length and has fine teeth at one end, wider teeth at the other. (Fig 18)
- **Sectioning clips:** These come in a variety of shape, styles, and sizes and can be made of plastic or metal. In general, two types are used: Jaw clips and duckbill clips. Both come in large and small sizes. (Fig 19)

Fig 16

Fig 17

Fig 18

Fig 19

- **Cutting sheet:** Water-resistant and bleach-proof material, protecting clothing of the client from spills and hair splinters. (Fig 20)
- **Apron:** The Barber Apron features water-resistant and bleach-proof material, protecting clothing from spills and hair splinters. Multiple pockets allow for multi-tool storage, and adjustable padded neck system provides extra comfort for long hours in the shop. (Fig 21)

Fig 20

Describe the hair cutting technique

Beside the basic hair cut, there are many techniques one can use to create different effects in the appearance and behavior of hair.

- **Texturizing:** The process of removing excess bulk without shortening the length; can be used for effect within a haircut; may be used to add or reduce volume.

Fig 21

to make hair move, to blend one area into another or to compensate for different densities on the same head of hair. (Fig 22a, b & c)

- **Point cutting:** Performed on the ends of the hair using the tips or points of the shears, may be done on wet or dry hair; the more diagonal the angle of the scissors, the more is taken away and the chunkier the effect. (Fig 23)

Fig 22a

Texturing technique
Point cutting

Fig 22b

Texturing technique
Slithering

Fig 22c

Fig 23

Texturing with shears

Point cutting

Notching

- **Notching:** A version of point cutting, more aggressive and creates a chunkier effect, may be done on wet or dry hair. (Fig 24)
- **Free-hand notching:** Uses the tip of the shears, do not slide, simply snip out pieces of hair at random intervals; works well on curly hair (releases curl and removes some density). (Fig 25)
- **Slithering:** Slithering is also known as Effilating; thinning hair to gradual lengths with shears; sliding movement; reduces volume and creates movement. (Fig 26)
- **Slicing:** Removes bulk and adds movement of hairs and may be performed on the surface or within a subsection. Slicing should be done on dry hair for

surface slicing, may be done on wet or dry hair for subsection slicing. (Fig 27)

Fig 24

Notching

- This is another version of point cutting
- It is more aggressive and creates a chunkier effect than point cutting
- Hold section about three inches from ends.
- Place tips about two inches from ends.
- Close shears moving quickly toward ends.

Fig 25

Free hand notching

- Also use tips of shears
- Shears not slid
- Places snipped out randomly
- Generally used throughout interior of hair cut
- Works well on curly hair.

Fig 26

Fig 27

- Carving: Version of slicing that creates a visual separation in the hair. (Fig 28)

Fig 28

Carving

- This creates a visual separation in the hair
- Works best on short hair
- Place stiff blade into the hair and rest it on the scalp
- Move shears through the hair; gently open and partially close shears as you move.

Describe the basics of blow drying (Fig 29)

Fig 29

A blow-dryer is an electrical device designed for drying and styling hair. A hair dryer/ blow dryer blow hot air over damp hair to speed the evaporation of water to dry the hair. The temperature control panel helps to produce a steady stream of air at the desired temperature. To keep your blow-dryer as safe and effective as possible, make sure that it is always perfectly clean and free of dirt, grease, and hair before using. Dirt or hair in the device could cause extreme heat and hair burn. The air intake that the back of the dryer must be kept clear at all times. If this intake is covered and air cannot pass through freely, the dryer element could burn out.

Identify precautions while doing hair cut

- Sterilize all your tools and equipment before and after every cut
- Cover your client with protective clothing, eg gown, cape, cutting collar, all the time you are cutting
- Keep their hair free from hair clippings
- Check the client's hair and scalp for cuts, abrasions and infestations before shampooing
- Store and handle your scissors correctly
- If you drop a comb or a pair of scissors on the floor, clean them or get a new one before you do any more cutting
- Make sure all hair is swept up immediately after you have finished the cut and, preferably, before you start blow-drying
- When using clippers, check that the plug, flex, casing, etc are in good working order. If you think they might not be, don't use them and report the fault to your tutor.

Yoga & its Components

Objectives : At the end of this lesson you shall be to

- explain purpose of yoga
- definition of yoga and its components
- explain benefits of yoga
- explain precautions.

Purpose

Good health is one's greatest asset. without good health, one cannot expect success in any walk of life. Yoga plays a great role in keeping good health. Regular yogic practice keeps the body active and fit.

Definition of yoga

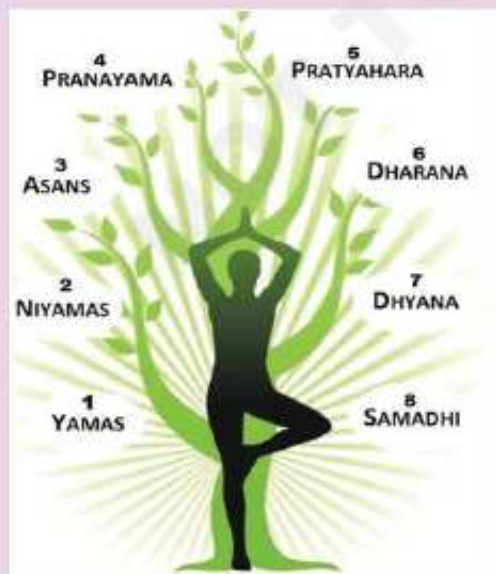

Yoga is derived from the sanskrit word "Yuj" which means union, becoming one. It means union of 'atma' with 'paramatma' (Fig 1)

Fig 1

Components of yoga (Fig 2)

Fig 2

The eight components of yoga are

- 1 Yama
- 2 Niyama
- 3 Asanas
- 4 Pranayama
- 5 Pratyahar
- 6 Dharna
- 7 Dhyana
- 8 Samadhi

The different types of yoga are

- Janana Yoga
- Hath yoga
- Karma Yoga
- Raj yoga

Jananayoga: Covers yama and niyama. It is the science of acquiring proper knowledge

Hath yoga: Covers asanas and pranayamas. It is the science of physical excellence.

Karma yoga: Covers pratyahar. It is the science of action.

Raj yoga: Covers dhama, dhyana and samadhi. It is the science of meditation.

The brief description of components of yoga

1 Yama: It includes the rules of social behaviour. It provides a good command over speech, mind, body and emotions. It is divided into 10 parts.

- | | |
|--------------|-----------------|
| a Ahinsa, | b Satya, |
| c Astya, | d Brahmacharya, |
| e Aparigrah, | f Mitahar, |
| g sauch, | h kshyama, |
| i dhruti, | j daya, k Aryab |

Ahinsa - Non injury to others

Satya - Truthfulness

Astya - Non stealing

Brahmacharya - Celibacy - continence

Aparigraha - Non - greediness

Mitahara - Habit of moderate food

Saucha - Purity of mind and body

Kshama - Forgiveness

Dhriti - To keep patience

Daya - to show sympathy Arya - to speak politely

2 Niyama: It includes those means which are connected to physical discipline.

3 Asanas: The word asana means the keeping of the human body in a particular position for maximum time. Asanas bring physical as well as mental steadiness.

4 Pranayama: It is the process of sitting on a fixed on a fixed place, taking in air by adopting a particular method and giving out air. Pranayama consists of two words 'Prana' meaning life on air, and ayama meaning control. The science of controlling prana is called pranayama.

5 Pratyahara: Detaching or withdrawal of senses from the external world and attaching to god is known as pratyahara.

6 Dharna: It is the practice of concentrating the mind on the external object.

7 Dhyana: It is flow of thoughts towards god. The stage is higher than dharna

8 Samadhi: At the time of samadhi, the man's soul is lost to god.

Note: The first four steps of yoga can be practised by all worldly persons.

The last four components of yoga can be practised by rishis, munis and yogis.

Benefits of yoga

- 1 Practice of yoga delays the ill effects of stress and ageing process
- 2 Yoga strengthens the weaker parts of the body
- 3 Practice of yoga causes relaxation
- 4 Practice of yoga can keep body physically, mentally and spiritually fit
- 5 Yoga has curative value for various ailments and disorders of women.
- 6 It enhances the sense of well being and improves memory.

Precautions while performing yoga

- 1 It is better to do yoga in an open space or in a well ventilated room.
- 2 Practice yoga on a soft mat.
- 3 It is essential to practice yoga under the guidance of expert.
- 4 Yogasanas should not be performed hurriedly or with jerks.
- 5 Each posture of asana must be maintained for sometime.
- 6 It is good to begin yogasanas with a set of gentle warm up exercises.
- 7 Eat nothing for an hour after yogasanas.
- 8 The ideal time to practice the asanas is morning and evening.
- 9 Clothes should be minimum and as per climate while practising yoga.
- 10 During menstrual periods yogasanas must not be practiced.

Yogic diet

Objectives : At the end of this lesson you shall be to

- define yogic diet
- explain the importance of yogic diet
- explain the benefits of yogic diet.

Definition of yogic diet

Yogic diet is also known as sattvic diet. It is a diet based on foods that according to yoga are strong in sattva guna. A yogic diet is a food that gives life, strength, energy, courage and self determination.

Importance of yogic diet

- 1 Providing energy to the body and mind, increase the resistance power of the body and to develop the mind. Fresh food gives lightness, happiness, joyfulness and increases intelligence. The food should be suitable for the mind, body, intelligence and soul.
- 2 It helps to promote inner calmness and harmony between the body and mind, whilst eating meat has

been linked with inner tension, anger, disharmony and an increase in desires. Vegetarianism is the basis of a sattvic diet.

- 3 Yogic Diet not only help to achieve both physical and mental balance, bringing peace and well being but also keep digestive system of human body which is one of the most important systems in the body and links all the other systems together. A poor digestive system is the core problem to many health conditions. It is affected not just by what we eat but also by our emotions. An awareness of the digestive processes and the choices we make in eating can help to achieve both physical and mental balance, bringing peace and well being.

- 4 Hence it is obvious that Food is seen as a carrier of the life force called prana and is judged by the quality of its prana and by the effect it has on our consciousness.
- 5 Don't eat unless you are hungry

Types of diet

Diet is of three kinds

- 1 **Sattvic diet:** This food renders the mind pure and calm
- 2 **Rajasic diet:** This food excites passion
- 3 **Tamasic diet:** This food fills the mind with anger.

Following are the type of foods classified as under:

Sattvic		Rajasic	Tamasic
Cow's milk, cream, cheese, butter, curd, ghee, sweet fruits, apples, bananas, grapes, papaya, pomegranate, mangoes, oranges, pears, pine apples, guavas, figs, vegetables, coconut, brinjals, potatoes, cabbages, spinach, tomatoes.	Cucumber, pumpkin, cauliflower, lady's finger, peaches, almonds, pistachios, raisins, wheat, red rice, dates, unpolished rice, barley, oat-meal, dried peas, sugar-candy, green gram, bengal gram, green pulse, ground nut, cereals, dried ginger, myrobalan, lemon, honey, charu.	Fish, eggs, meat, salt, chillies, chutney, asafoetida, pickles, tamarind, mustard, sour things, hot things, tea, coffee, cocoa, ovaltine, white sugar, carrots, turnips, spices	Beef, pork, wine, onions, garlic, tobacco, rotten things, stale things, unclean things, twice cooked things, all intoxicants, all liquors, all drugs.

Benefit of yoga diet

- Yoga diet provides harmonious development, physical, mental & Spiritual
- Yoga diet increases efficiency, stamina, firm and vigour.
- Yoga diet keeps us always healthy, and fresh.
- Yoga diet is a easy digestion process which increase resistance power of the body.

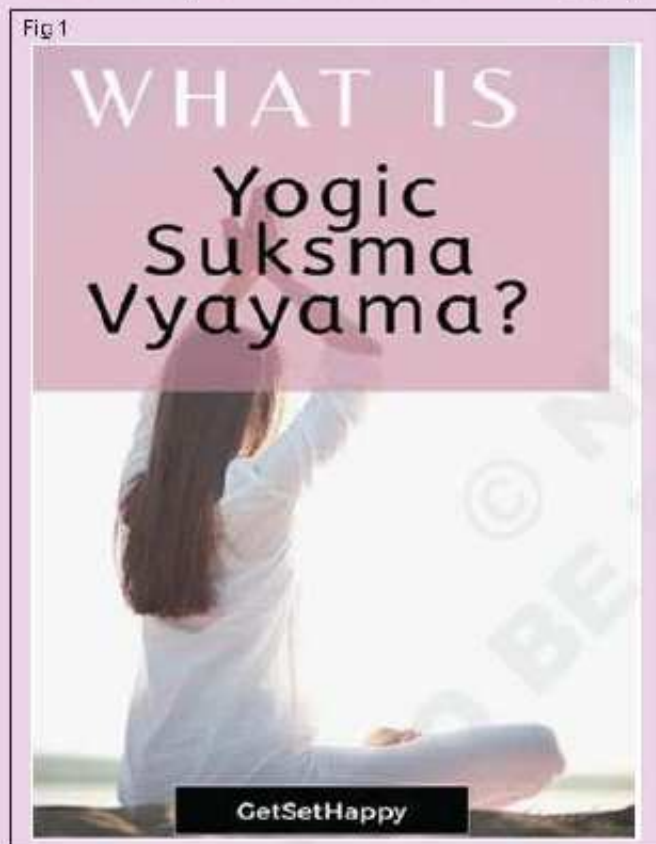

Yogic sukshma vyayama

Objectives : At the end of this lesson you shall be to

- **purpose of sukshma vyayama**
- **definition of sukshma vyayam**
- **benefits of sukshma vyayam**
- **precautions of suksham vyayam.**

Purpose of sukshma vyayama

This group of 48 exercise is concern with loosening up the joints of the body. It eliminates energy blockages in the joints and outer extremities of the physical body and works with the pranic and mental level as well. (Fig 1)

Definition of sukshma vyayam

Yogic sukshma vyayam is defined as the series of exercise done by standing position, concentrating on breathing and various parts of our body from head to toe; that improves health, beauty and strength of different organs and system in the body. Sukshma Vyayam consists of 48 exercises. They are as follows:

Benefits of sukshma vyayam

1 Prarthana

- It increases the power of concentration.
- It provides mental peace and self meditation.
- It is curable for mental diseases.
- Blessing of GOD is sought.

2 Ucharana sthala tatha visuddha chakra shuddhi

- It provides the clarity in pronunciation of the word.
- Disorders like Stammering and speech problem can be cured.
- It is much beneficial for the singers and musicians.
- It increases the power of thinking.
- Harsh voice becomes sweet.

3 Buddhi tatha dharti - shakti - vikasaka

- Memory power is increased.
- Development of positive thinking in every aspect.
- Rational power of brain is increased.
- Mental defects are cured.
- Will power is increased.

4 Smarana shakti vikasaka

- Brain disease like illusion, imbalance of brain, low memory etc can be cured.
- No feeling of tiredness.
- Working capacity is enhanced.
- Memory power is gained.

5 Medha shakthi - vikasaka

- Vocal Glands are refined day by day.
- Laziness in the body, sleeping problem is removed.
- Cough is cured.
- Body becomes active in day to day working.

6 Netra shakthi - vikasaka

- It improves the muscular Power, balance and coordination of the various muscles moving on eye ball.
- It makes strong internal structure of eyes resulting power of sight is increased, and continuously practice at least 40 days regularly spectacles are removed.

7 Kapala shakthi - vikasaka

- Cheeks become red and healthy.

- Oral infection would be prevented and cured
- Muscles of the face becomes active
- Age is increased
- Acne , boils etc. Stop appearing.

8 Karna shakthi - vikasaka

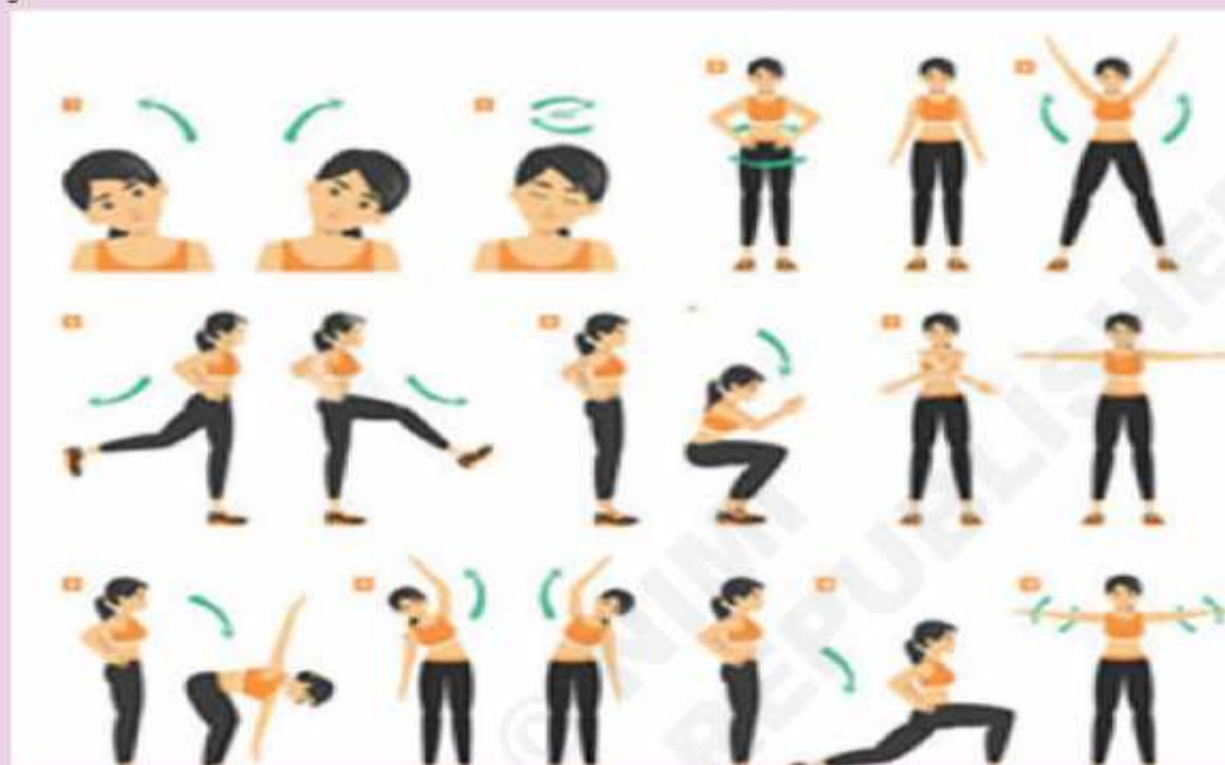

- Vibration on ear drum increases the purity of the hearing

- Diseases of the ear is cured

9 Griva shakthi - vikasaka - 1

- Thickness of neck is reduced and it becomes strong
- Speech becomes sweet
- Disorders like tonsils are cured (Fig 2)

Fig 2

10 Griva shakthi - vikasaka - 2

- It is effective in throat diseases
- Speech becomes more clear

11 Griva shakthi - vikasaka - 3

- It provides the strength to the neck and makes it beautiful
- The voice becomes resonant.
- Speech defects like stammering and lisp are completely removed.
- Singers will derive great benefit from it.

12 Skandha tatha bahu mula shakthi - vikasaka

- The bones, blood vessels, the muscles and nerves in the shoulder are toned up.
- It makes the shoulder strong.

13 Bhuja bandha shakthi - vikasaka

- Under developed arms will develop good muscles
- Heavy arms will become slimmer
- The elbow joints become strong

14 Kohani shakthi - vikasaka

- It cures malformation of the elbows and strengthen the joints
- The circulation of the blood in the arteries is accelerated that gives fresh strength to the entire length of the forearm starting from elbow.

15 Bhuja - valli shakthi - vikasaka

- It provides the power to the hand making arm to be strong
- Arms and elbow become healthy strong and beautiful

16 Purna - bhuja shakthi - vikasaka

- Shoulder becomes strong
- The internal nerve become strong

17 Mani - bantha shakthi - vikasaka

18 Kara - prastha shakthi - vikasaka

19 Kartal shakthi - vikasaka

20 Anguli mula shakthi - vikasaka

21 Anguli shakthi - vikasaka (17 to 21)

- Wrist, neck, palm and fingers become well-built and beautiful
- Heart becomes strong. (Fig 3)

Fig 3

22 Vakshasthala - shakthi - vikasaka (1 to 2)

- Tuberculosis, bronchitis etc can be tackled more effectively.
- It is helpful in chest diseases
- Back bone becomes strong for long life

23 Udarashakthi shakthi - vikasaka (1 to 10)

- Stomach disorders are immediately cured.
- Digestion power of the body is increased
- Blood circulation becomes more clear
- Veins become more effective and smooth for working
- The fat of the belly is reduced

24 Kati shakthi - vikasaka (1 to 5)

- The above exercise for the back makes it flexible and symmetrical.
- Regular exercise removes all minor distortion of the back.

- It enhances the height. It is a advantage for short person

25 Muladhar chakra shuddhi

- Slenderness replaces fatness
- Even the aged persons look young by means of this exercise

26 Upasth tatha swadhistan chakra shuddhi

- Sexual disorders cured.

27 Kundalini shakthi - vikasaka

- A person who practice kundalini shakti that gains the knowledge of truth

28 Janga shakthi - vikasaka

- These exercise develops the thighs and makes them shapely.
- Thin limbs acquires healthy flesh

29 Janu shakthi - vikasaka

- It improves blood circulation in the region
- This exercise is good for rheumatic pain

30 Pindali shakthi - vikasaka

- It is good for legs

31 Pada - mula - shakthi - vikasaka

- The calves become strong and beautiful.
- The sole becomes beautiful, well shaped, strong and stout.
- One gets rid of rheumatic conditions.

32 Gulf pad pratha , padatala shakthi - vikasaka

- The ankle ,toes and feet are strengthened.
- The feet become beautiful, strong and well shaped
- All the diseases of the feet are cured.

33 Pad anguli shakthi - vikasaka

- Feet become strong

Surya namaskar

Objectives : At the end of this lesson you shall be to

- describe surya namaskar
- define purpose of surya namaskar
- explain benefits of surya namaskar
- explain do's and don'ts.

Surya namaskar

Surya namaskar is a Sanskrit word which. The literal meaning of Surya Namaskar is 'Salutation to the Sun'. Salute to the Sun or Sun Salutation, is a practice in yoga as exercise incorporating a flow sequence of some twelve gracefully linked asanas

Surya namaskar consists of 12 different postures and is done along with chanting of mantras in every posture. (Fig 1)

Fig 1

Purpose of surya namaskar

This exercise is good no matter what time you may use it, but it is best done while the stomach is empty, before eating. If performed correctly, this exercise composed of 12 bodily poses does not strain or cause injury. It, relieves stiffness, revitalizes your body and refreshes the mind. Do it during the day and it will instantly boost you up. (Fig 2) Surya namaskar is traditionally performed on empty stomach at sunrise which is considered the most spiritually favorable time and facing the rising Sun.

Benefits of surya namaskar

- 1 It improves the blood circulation of all the important organs of the body.
- 2 Improves the function of heart and lungs.
- 3 Makes the spine and waist more flexible.
- 4 Improves digestion.
- 5 Improves the concentration.
- 6 Helps to reducing the fat around the abdomen.

Fig 2

- 7 Surya Namaskar practice calms the mind, thus helps to get sound sleep.
- 8 Surya Namaskar practice boosts blood circulation and helps to prevent hair graying, hair fall, and dandruff. It also improves the growth of hair making it long.
- 9 This exercise is useful for every man and women, aged person, child and young.
- 10 It is beneficial to practice Surya Namaskar early in the morning. The early morning sunrays are rich source of vitamin D that is necessary to get strong bones and clear vision.

Precaution/do's & don'ts

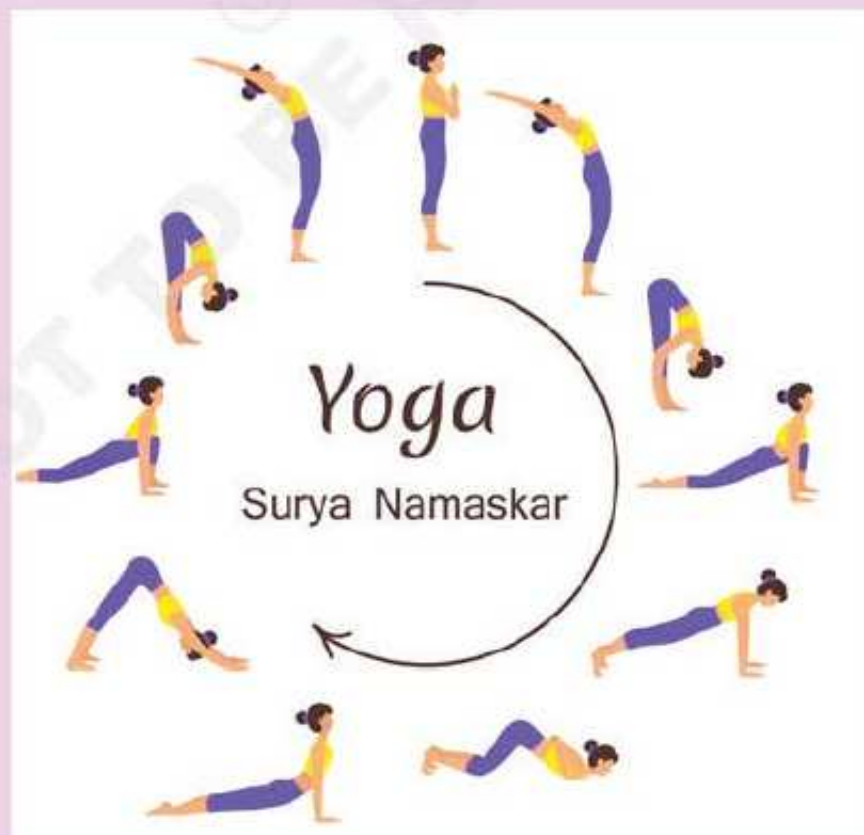

- 1 Persons suffering from slip-disk, arthritis, heart attack etc including pregnant women are suggested to take medical opinion before they start the practice of Surya Namaskar.
- 2 During the onset of menstruation, this practice should be avoided.
- 3 This exercise is good no matter what time you may use it, but it is best done while the stomach is empty, before eating.
- 4 This yoga practice must be performed empty stomach or after 3-4 hours of having meal.
- 5 Do not drink water or any other liquid material immediately before performing Surya namaskar.
- 6 The best time to perform this yoga practice is in early morning.

7. Do not go for bath immediately after performing Surya namaskar, there must be gap of at least 20-30 min between Surya namaskar practice and taking Bath. The preferred practice is to first perform the Surya namaskar then after 30 min go for bath.
8. Having breakfast, lunch, dinner or any other sort of light or heavy meal immediately before performing Surya namaskar is also prohibited. (Fig 3)
9. Always perform it in either in East or west direction. North is also considered as a good Direction to perform it. Better to perform it in open space or in words its preferable to perform in oxygen rich environment. (Fig 4)

Fig 3

Fig 4

Meditation

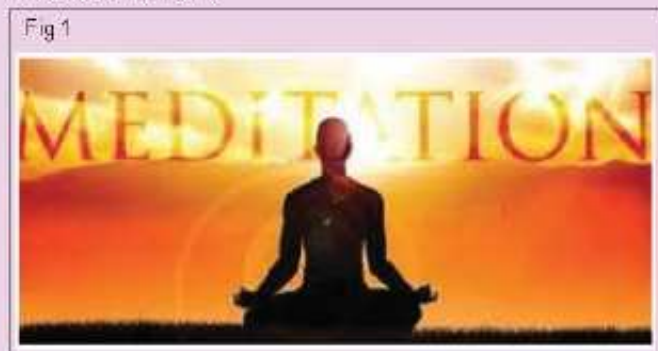

Objectives : At the end of this lesson you shall be to

- **define meditation**
- **explain procedure of meditation**
- **explain benefits and safety precautions.**

Definition

Meditation is an art of mental quietness and can be attained by withdrawing all thoughts from all directions and focusing on a single point or object

A contained flow of thought or perception is called meditation (Fig 1)

In initial stages of practice, the mind tries or tends to run away in different directions. But by constant efforts or practice, mind is brought back to the same point of object and finally one gets concentration and meditation starts.

Procedure: Same as practical

Benefits: (Fig 2)

- 1 Meditation reduces high blood pressure or hypertension.
- 2 Meditation reduces stress level.
- 3 Meditation controls the body temperature.
- 4 Meditation increases concentration
- 5 It is a powerful tonic and increases energy.

Safety precautions

- 1 Do not allow the mind to wander away.
- 2 Try to be cheerful and peaceful
- 3 Think gently about an object in a gentle and continuous manner.
- 4 The stomach should not be full.
- 5 Meditation should be done in a calm environment.

Fig 2

Skin structure

Objectives : At the end of this lesson you shall be to

- explain about the skin structure
- function of the skin
- explain about colour theory
- explain about make up.

Skin structure : Skin is the largest organ of our body because it covers our entire outside body. It covers muscles, bones, and internal organs. In our whole body, we have skin from head to toe, it acts as a cushion. It protects our internal Body from dust, Bacteria, infection, etc. Skin is an area of the integumentary system. Healthy skin is a sign of good health. The study of skin, its diseases, disorders, and treatment are called dermatology, and one who does this is a dermatologist or skin specialist.

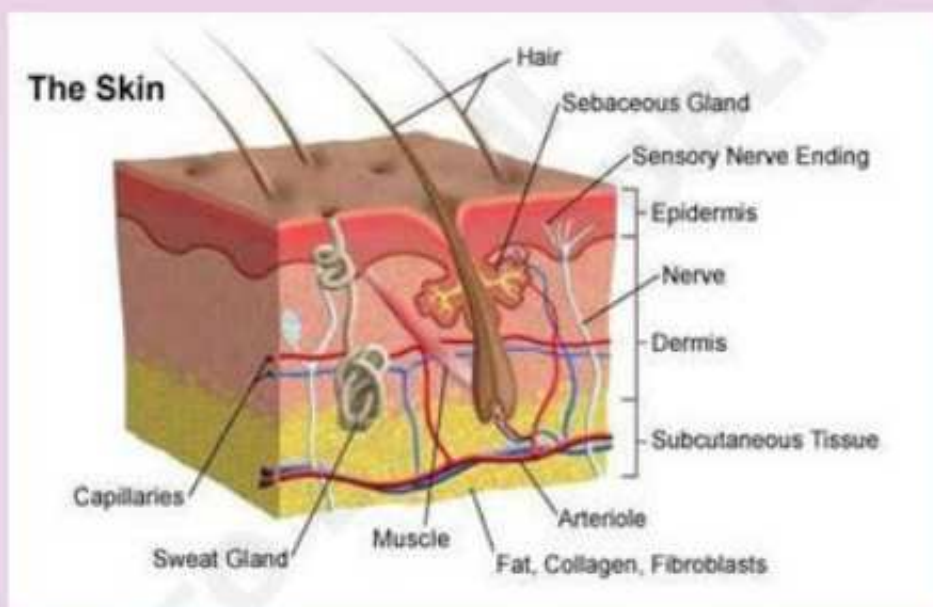

Composition of skin - skin is made up of water, protein, fat, chemicals, and minerals.

Layers of skin (Fig 1)

There are 3 layers of skin

Epidermis, dermis, hypodermis or subcutaneous layers. These 3 layers are different in thickness, function, and strength.

Fig 1

Epidermis - The epidermis is a Greek word that means 'over' or 'upon'. It means this is upon or over to the dermis layer. This is the first and outermost layer of skin. The skin, which we touch and see is the epidermis layer. This layer gives protection to two inner layers. It is a waterproof layer. This is the thinnest layer in all three layers. In this layer different types of cells are found which have different functions such as they produce the main hard protein known as keratin and produce pigments also.

For understanding more, we will go through sub-layers of the epidermis layer. The thickness of eyelids is 0.5mm and on palms and soles of feet is 1.5mm.

Sub layers of epidermis layer

- a Stratum corneum
- b Stratum lucidum

- c Stratum granulosum
- d Stratum spinosum
- e Stratum germinativum

Stratum germinativum: It is an active layer and the innermost layer of the epidermis layer. It is just above the dermis layer. Germinating means to produce. Another name of this layer is the basal layer as it contains basal cells.

The function of basal cells

- a Basal cells continuously divide cells, new cells constantly push older ones up, towards the surface of the skin. From the surface of the skin, they shed (take away), when we do scrubbing.

- b The basal cells layer contains cells called melanocytes. Melanocytes produce a pigment called melanin. It gives color to our skin. If melanocytes produce more melanin then skin becomes dark, and if produce less, so the skin becomes lighter in color. So it helps to protect deeper layers of the skin from harmful effects of the sun because of sun exposure, melanocytes produce more pigment which gives us a sun tan.

Stratum spinosum: It is just above the basal layer. It is the thickest layer of the epidermic layer. Spinosum means 'spiny layer' since the cells are held together with spiny projections. Within this layer are the basal cells that have been pushed upwards, however, these maturing cells are now called Keratinocytes, where keratin is produced. Keratin is a soft protective protein that makes up the majority of the structure of the skin, hair, and nails.

Stratum granulosum: This is the 3rd layer of the epidermis. As these cells move further towards the surface of the skin, they get bigger and flatter and adhere together, and then eventually become dehydrated and die. This process results in cells fusing into layers of tough, durable material, which continue to migrate up to the surface of the skin.

Stratum lucidum: The stratum lucidum layer is present in thick skin where it helps to reduce friction and shear forces between granulosum and corneum layer.

Stratum corneum: This is an outermost layer of epidermis. In this layer, old cells are continuously shed and new cells take birth. This shedding process slows down with the age.

It takes 28 to 30 days in young adults and 45 to 50 days in elderly adults. We also call it the horny layer as its cells are toughened like an animal's horn.

Dermis layer: This is the 2nd layer of skin. It is made up of collagen and elastin protein. Its thickness is 1.5mm to 4mm. It gives approximately 90% thickness to the skin. It is just below the stratum germinativum. This is the thickest layer in all three layers. It has two sub-layers:-Papillary layer and Reticular layer

Papillary layer: It contains thin collagen fibers. It supplies nutrients and regulates temperature. It provides oxygen and sustains the basal layer to maintain active cell division.

Reticular layer: It is made up of thick collagen fibers. It gives strength to the skin. It gives elasticity to the skin because in this layer we have elastin protein. In this layer, we have glands, hair follicles, blood vessels, nerves. It is the real layer of the skin, it is the main layer of the skin because in this layer we have blood vessels, hair follicles, nerve endings, sweat and sebaceous glands, collagen and elastin protein, lymph vessels. Blood vessels supply nutrients and oxygen to the skin. Hair follicle is a tube-like structure that covers the hair and gives protection to the hair. Sweat gland produces sweat. It is found over the entire body. These glands regulate body temperature.

Sebaceous glands are attached to hair follicles. These glands secrete oil that helps keep the skin smooth

and supple. The oil which is produced by this gland is called sebum. This oil helps keep skin waterproof and protects against an overgrowth of bacteria and fungi on the skin.

Arrector pilli muscle: It is a tiny muscle connected to each hair follicle and epidermis when it contracts, it causes the hair to stand erect. The dermis layer also contain nerve endings like cold and heat receptors, pain receptors, pressure receptors, and sensory cells that transmit information to the brain for interpretation. The dermis layer is made up of a protein called collagen made by fibroblasts (fibers). Fibroblasts are skin cells that give the skin its strength and resilience. It is a tough, insoluble protein found throughout the body. It is present in the connective tissues that hold muscles and organs in place. Elastin is a similar protein that allows the skin to be firm. It gives flexibility and firmness to the skin. Elastin gives us elasticity. Collagen and elastin reduce with the age. In ageing skin, it is less. That is why skin gets saggy and wrinkles.

Subcutaneous layer: It is the innermost layer of the skin. Its another name is hypo dermis or sub dermis layer. It consists of fat cells and collagen cells.

Functions of hypodermis layer - Protecting the inner organ, Conserve the body's heat, acts as an insulator, work as a shock absorber, It stores fat cells in it as an energy reserve for the body when there is a requirement for energy in the body. These fat cells turn into energy. It contain blood vessels, nerves, lymph vessels, and hair follicles also cross through this layer. The thickness of the subcutaneous layer varies through the body and from person to person.

Functions of Skin: The skin has a variety of functions. Following are the functions of the skin.

- 1 Temperature Regulation/Heat regulation:** Normal temperature of the human body is 98.6 degrees F. Our skin helps to keep the temperature constant. How? In hot weather, our sweat glands are very active, they produce more sweat. In this way heat of the body gets out. But in winter sweat glands are less active. So, it produces less sweat. In this way, heat can be kept within the body in winters (when the cells of our body break down, food heat is produced. Blood carries this heat in the skin when evaporation of sweat cools the body, no matter how cold air or hot air is outside. Body temperature always remains constant.
- 2 Protection:** Skin gives protection. It is tough and waterproof. It acts as a barrier to infection. It prevents microorganisms and other substances from entering the body. It protects from harmful bacteria and prevents the absorption of many chemical substances. Many people are allergic to a chemical in certain cosmetics and these substances were able to penetrate the skin. It acts as a cushion that protects the internal tissue from injuries.
- 3 Absorption:** Although the skin is the protecting covering some substances can penetrate in a limited

way, like topical medicine, some cosmetics such as emollient and plant extract, aroma oils can penetrate through the hair follicle, and sebaceous gland opening.

- 4 Sensation:** By stimulating sensory nerve ending, skin responds to heat, cold, touch, pressure, and pain. When some mosquito bites us. You respond by saying touch. Oh! Because nerve ending are stimulated and they send message to the brain. Same as when you feel pain by scratching and pulling away when you touch a very hot thing that sends a message to the brain-our nerve ending. And brains tell us to react in a situation. This is very quick and fast. Sensory nerve endings are located near the hair follicle.
- 5 Secretion:** Secret means to produce to secret. In our skin, we have a sebaceous gland, which produces oil or sebum. Sebum keeps our skin soft, supple, and lubricated. It is a natural oil that is present in our skin. If it would not be there, so there is no natural oil in our skin and our skin become dry and scaly.
- 6 Excretion:** Excretion means to take out. We throw away or we take out our waste products and toxins from the body through sweat, urine, stool but in the skin we consider sweat. Water lost through perspiration takes salt and other chemicals with it.
- 7 Production of Vitamin D:** Skin produces Vitamin D through exposure to ultraviolet radiation in sunlight. When we are out in the exposure of sun, the sun gives to our skin, Vitamin D. It synthesizes Vitamin D.

Purpose of makeup : Purpose of makeup This is an art, in which any type of woman who looks normal can be made very beautiful by make-up. It is not only from today but is as old as our civilization. But the only difference is that in the olden days, women used coal instead of kajal and rose leaves instead of lipstick. But with the passage of time there was a change in make-up and many salons were opened and in today's time every person goes to the salon to get make-up done.

People prefer makeup because of the following reasons

- 1 Boosts confidence:** For many women, makeup is a confidence booster. Many of you might not be used to leaving the house without putting on any makeup. In fact, there are many women who don't want anyone to even see them until they have put on some makeup. This could be termed as a bit of an extreme obsession though. While a lot of women do accept that makeup helps them feel more confident, even minimal makeup is good enough for many others. Hence, the amount of makeup required to boost confidence varies greatly from woman to woman.
- 2 To look older:** All of you could probably agree to the point that makeup has the power to change your appearance to an extent and some people use it for this very same reason. Teenage girls or girls with a baby face often use makeup to seem older and more mature.

- 3 To look younger:** Just the way that makeup can make you look older, it also has this uncanny ability to make you look younger as well, especially if you know those tips and tricks that can make you look younger with the help of some makeup. There are quite a few beauty products out there that can help in reducing the appearance of fine lines and wrinkles on your skin, thereby making you look much younger.

- 4 Enhance beauty:** Makeup cannot really change the absolute appearance of your face or transform you into some other person completely. It can only perhaps be used for enhancing your features at the most. If you have dreamy eyes, you can make them appear even more beautiful by focusing most of your makeup on just your eyes. (Fig 2)

Fig 2

- 5 It is so much fun:** Makeup is a form of art and just like many other such forms, it is also a lot of fun. You can try out different looks using makeup, transform yourself into a completely new person or even just look pretty much different from the previous day. With patience and practice, you can easily learn this art and if something does go wrong in the process, you always have the option to just wash the makeup off of your face and start again.

- 6 Clear complexion:** With the help of makeup, you can easily cover up all those complexion-related issues that might be troubling you. From acne and dark circles to an uneven skin tone, makeup can help you effectively cover them all up. However, the only way you can achieve a seemingly clear complexion is by applying makeup correctly. This way, your skin will look clear and free from any blemishes and discoloration.

Effects of light on makeup

Lighting is very important when it comes to makeup, for texture and pigmentation. Lightning usually depends on what occasions you are going on. Be it a wedding, some party or let it be a dinner/Lunch. Lighting is very important for precision and accuracy when applying makeup. The occasion for which the makeup is needed and the time of the day the makeup is applied and ultimately worn are factors to be considered when applying makeup. Lightning controls makeup to a high degree. Makeup can lose its effectiveness due to incorrect stage lighting. Conversely, skillful lighting can greatly aid the art of makeup. Close

communication between the lighting director and the makeup artist is crucial for the best possible effects. (Fig 3)

Fig 3

Classification of lighting

Natural lights (pure daylight) and artificial lights

Natural lights - Our only source of natural light is Sun. when it comes to sun we all get very much conscious because of the UV rays and hence our skin looks more in detailed texture during sunlight. Hence we do our makeup according to the Natural lights reflects on the face from any surface it hits. Unlike artificial light, natural lights shows up the true colours and textures of the makeup. This is so because natural light doesn't cast shadows. When makeup that is meant be worn under natural light or during the day (for instance, beach makeup, bride or party makeup) is applied under artificial light, by the time the makeup look is seen under natural light, the application mishaps and possibly makeup mis-match are revealed by the natural-day light.

Artificial light - It is not natural light. We have grouped artificial lighting into two - Yellow lights and White lights. For photography or Cinema for instance, yellow and harsh white lights that are mostly. When yellow light is used, sometimes, the brightness is mostly softend with shades which directs the amount of light given out downwards thereby causing the light to look more dull, makeup colours and foundation shades looking darker. In other occasions, the yellow light is concentrated on the face and as a result some of the colours are changed simply turning purple to a bluish colour, it also reduces the intensity of red, making them appear darker, it reduces and softens the intensity of gold colour as well. White fluorescent light on the other hand, even though it is the closest to the natural day light, it immediately makes the face look white, thereby lighter foundation that the client's or model's complexion can be mistakenly applied. Artificial white light also has the tendency as well to make bright colours look too bright. The era of LED lights have made proper lighting for makeup application very simple and you can find various ones for your budget. LEDs are

like white light, but they emit less heat, use less energy and mostly they come with diffusers and soft filters which reduces the harsh lighting effect usually produced by fluorescent light. (Fig 4)

Fig 4

Any makeup look that is meant for a day light occasion should always be done with pure white light reflecting on the face directly and in the absence of artificial light. For makeup looks for night events which will ultimately seen under artificial light can be worn under artificial lighting, but instead of so much of foundation and powder, use more shimmers on the eyes and on lips, and make the face less subtle.

Types of lighting and their effects on makeup

- 1 Tungsten artificial light - creates orange/yellow cast that dulls blue tones and darks reds.
- 2 Fluorescent light - creates a green cast that removes the warmth from colours.
- 3 Natural daylight - creates a bluish cast.

Coloured light effect on makeup

- 1 Pink - warms most colours but makes blues and greens
- 2 Red - red tones appear lighter, green shades appear darker, blue becomes darker and grey
- 3 Green - darkens red, lightens green, blue appears dark green and purple appears darker.
- 4 Violet - turns most shades orange, browns appear darker and greens appear grey
- 5 Yellow - blues and greens appear grey.
- 6 Peach - warms the skin but does not change makeup colours.

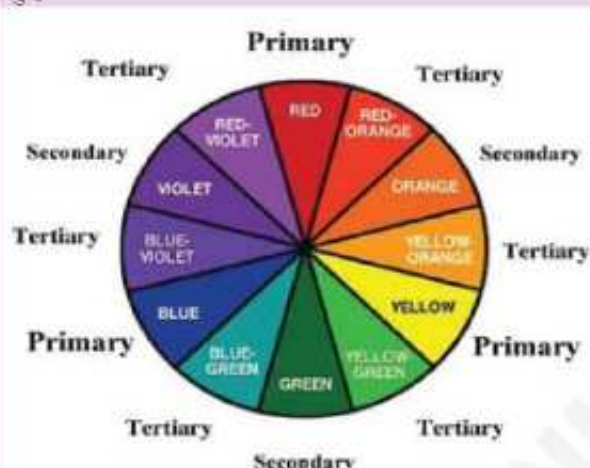

These lightning helps for the events, shoots and many other things. If we take the yellow light which will dull the blue and makes the red darker similarly all other lights have their own drama which will add up a story to your occasion.

Colour theory: Understanding colour theory is essential for makeup artists. It is one of the principal foundations

of everything that the makeup artist does. For example, successfully recognizing and matching a client's skin tone needs an understanding of colour. Likewise, corrective makeup, complementing natural colouring, blending in prosthetic pieces and creating realistic casualty effects relies on colour theory knowledge as much as technique. Colors play an important role in our life. Everywhere we choose color, like Fashion Designing, Paintings, Make-up etc. Colors play an important role in our life. Without colors, our life seems colorless. Whenever we see a beautiful flower, the first thing we see is its color. Looking at the beautiful color of the flower. Color is a light and the circle of colors is called color wheel.

The colour wheel (Fig 5)

Fig 5

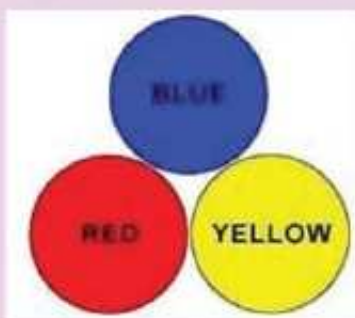

The colour wheel is a simple way to look at the basic relationship between the twelve colours shown on the wheel. It also explains, in simple terms, how to mix colours to create new ones. It is a visual aid in helping us understand the principles of color and the color theory.

The Red-Yellow-Blue colour wheel showing the main twelve colours that are part of the Primary, Secondary and Tertiary colours.

Primary colours

The primary colours are red, yellow and blue. When two primary colours are mixed, it creates a secondary colour. So, red and yellow make orange. Yellow and blue make green. Blue and red make purple. Using the primary colours, you can mix pretty much any other colour in the spectrum. Hence knowing your colour theory is so important. (Fig 6)

Fig 6

When all three primary colours are mixed they make a brown. Therefore, different shades of brown can be made by mixing the primary colours in varying proportions.

Secondary colours

The secondary colours are orange, green and violet. (Fig 7)

Fig 7

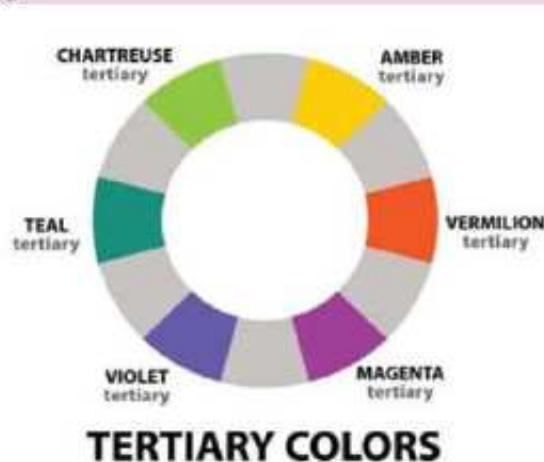

They are made by mixing equal amounts of two primary colours. By mixing different proportions of two primary colours, you will create variations of a secondary colour. For example, if you mix equal amounts of red and yellow, you will create a classic orange colour, as seen on the colour wheel. However, if you mix a little more red colour into a yellow, you will create a darker orange colour.

Tertiary colours

The tertiary colours are vermilion, amber, chartreuse, aquamarine, indigo, and violet-red. (Fig 8)

Fig 8

They are made by mixing one primary colour equally with one of its adjacent secondary colours. For example, a 50:50 mix of red (primary colour) + orange (secondary colour and situated next to red on the colour wheel) = vermilion.

Complementary colours

Each colour has a complementary colour - namely, the one that is opposite it on the colour wheel. For example, blue and orange are opposite each other and, therefore, are complementary to each other. (Fig 9)

Fig 9:

Harmonising colours

Colours that share one primary colour are called harmonizing colours. For example, blue, indigo and violet are harmonized, as they all share blue as part of their colour. Likewise, green, chartreuse and yellow are harmonized, as they all share yellow. (Fig 10)

Fig 10:

The color wheel may further be divided into warm and cool colors. By understanding the differences of warm & cool colors, it will help you better in foundation & concealer color matching on different color skin tones.

Warm colors (Fig 11)

Fig 11:

Warm color spectrum

Warm colors are bright, passionate and energetic, and tend to be eye-popping colors. Warm colors include: red, orange, and yellow, and variations of those three colors.

Cool colors (Fig 12)

Cool color spectrum : Cool colors give an impression of calm, and create a soothing impression. Cool colors include: violet, blue, and green.

Fig 12:

Basic facial shapes knowledge

It is a makeup in which correction is done by which bad features are hidden and good features are raised. It is concealed embossed with two colors. Dark color and Light color. Due to which the ordinary woman starts looking more beautiful. To assess the client's face shape, take the hair away from the face and study the size and shape of the facial bone structure. Consider the amount of excess fat, and the muscle tone.

Seven types of face shapes (Fig 13)

Fig 13:

- 1 Oval face shape** - It is considered as perfect face shape. No correction is required on this face. It is also called Universal Shape because the correction of other faces is done by keeping this shape in mind.
- 2 Round face shape** - Light color foundation is applied on forehead and chin so that the face appears oval. The area around the cheeks is raised, to make it appear oval, a dark color foundation is applied from the temple to down point of ear.
- 3 Long face shape** - In a long face, the forehead and chin are longer and the cheeks are suppressed. Dark color for pressing chin and forehead and light color for cheeks are used.
- 4 Square face shape** - In Square face, jawline and the forehead appear wider, keeping in mind the oval face, dark color is used on the forehead and side on the jawline and light color is used between the forehead and the chin, so that square face to face oval.
- 5 Triangular face shape** - In this face jawline is wide and forehead is thin. with use of light color foundation on forehead and dark color foundation on jawline, we can make it oval.
- 6 Inverted triangular face shape** - If the width of the forehead is more and the width of the jawline is less,

then use dark colour on forehead light colour on jawline.

- 7 **Diamond** - In this you have narrow forehead and jawline. Use darker colour on forehead and jawline

Product knowledge

Make-up is an art the one who make this art is called Makeup Artist. A make-up artist should have proper knowledge of the products and tools before doing make-up and also knows on which skin they will be used. Make-up product plays an important role in any make-up. Any person can look more beautiful through using Make-up products. Make-up Artist enhances the beauty of the face and hides the defective appearance, but to complete all these, an Artist must first have the correct knowledge of the entire products. If we have many other products in front of us, but if we do not know how to use them properly, then we can reduce someone's beauty instead of improving. So, we should have complete information about all products. In this way, only after having complete information, we are also able to choose the perfect product from among the other brands.

List of all products required for doing makeup

- 1 **Make-up remover**- This product is used to remove the make-up already done on the client's face. To remove Eyes and Lips Make-up, it should be used with Ear buds.
- 2 **Cleanser** - it is used to remove dust from the skin. (Fig 14)

Fig 14

- 3 **Toner** - After cleaning, the pores of our skin become open, use toner to minimize them, of toner you can also use rose water.
- 4 **Moisturizer** - it is used to moisturize dry skin well, but oily skin and moisturizer should be avoided in summer season.
- 5 **Pre-base** - It means the primer. They create a smooth a clear layer on our skin which acts as a protective layer on our face and helps the base to last longer. It is used to make make-up effective. If our base will be strong and durable, then our make-up building will also be very beautiful.
- 6 **Neutralizer** - It is used in balancing the dullness of the skin, it is found in two form i.e liquid and powder form.

- 7 **Concealer** - It is used on the face to hide skin problems like Dark circles, pimple marks, pigmentation, scars etc. (Fig 15)

Fig 15

- 8 **Foundation** - It is useful for giving even the skin tone. It is available in liquid and cream form. It makes the skin smooth and even.
- 9 **Translucent powder** - It provides a finishing touch to Make-up. It works to keep Make-up lasting for a long time, control sweat and oil. It also has two forms i.e Loose Powder and Compact Powder.
- 10 **Shimmer powder** - To give shining on face, Shimmer powder is used. It is used for highlighting. It is used according to the costume work. It is also available in cake form.
- 11 **Blusher** - Blusher is a coloring make-up product that shows sharpness. This makes cheeks attractive. Wrong choice of blusher can reduce beauty. It is available in cream and cake form. This is used according to the skin complexion. It may be used for highlighting & contouring.
- 12 **Two way gel** - Two way gel is used in two ways. First, In the eye socket area before starting the eye make-up, it helps the eye shadow last longer. Second, To fix the powder from Glitter or pigment, as it is in transparent form, so that there is no change in the color of the eye shadow. It can be used on eyebrows also.
- 13 **Eye shadow** - Eye Make-up is done on the basis of occasion and costume & preference of client. It is available in pressed cake & cream form.
- 14 **Color pigment** - Color pigment is used to give extra color to the eye shadow. This is used in giving glamour look. It is available in Shimmer, Glitter & pigments.
- 15 **Highlighter** - Light coloured eye shadow is used as a highlighter on the lower part of the eyebrows. In this golden, silver, white or very light yellow shades are used.
- 16 **Eye liner** - A soft line is made from dark color on the eye lashes line. It is also applied under the eyes. It makes the eyes big and attractive.

17 Mascara - With the help of mascara, eyelashes are thickened and lengthened. The thickness of the eyelashes is increased with Primer Mascara or volume mascara. This makes the eye makeup appear sharp.

18 Lip liner - It is used to give proper shape to lips. It is used for giving correction on lip.

19 Lipstick - After lip liner, lipstick is applied with the help of a brush. The lipstick should be consistent with the skin tone. It is available in matt, creamy and glossy form.

20 Lip gloss - Lip gloss is used to give shining to lipstick. The dryness of Lips is reduced due to its use.

Tools for make up

If an artist has his raw material but does not have tools, then his skill is incomplete. Make-up Tools play a huge part in makeup. In this the tools are divided into 2 parts.

a Make-up brushes : They are an important part of their makeup kit, without this creativity is impossible . They should be of good quality. Good work is possible with good tools. Without them make-up cannot be imagined. (Fig 16)

Fig 16

b Varieties of sponges - There are three varieties of sponges. Latex sponge & oval Shape / Open pores sponge 3. Powder Puffs etc.

Day makeup (Fig 17)

Fig 17

The purpose of daytime makeup is often to highlight natural features, conceal flaws and blemishes in the skin, and promote a fresh and awake appearance.

Daytime makeup looks are generally subtler than evening or nighttime looks because the natural light of the sun makes heavy makeup jobs more apparent. However, the makeup you wear during the day must also be long-lasting without being too thick. Daytime makeup is more natural and simple. During the day you do normal stuff, go to work, go shopping, go for a walk. It's called routine. You do common, basic stuff.

Daytime makeup means nude colors, natural glow and a rather small amount of make up. For day time most people prefer a dust of bronzer over the cheek bones to add warmth to the complexion. Daytime make up is usually nice and light. It is considered the makeup you would wear out to school or work. We tend to go lighter on the product and steer clear from heavy lip color and smokey eyes.

Evening and party make-up (Fig 18)

Fig 18

For any makeup, the first concern is to know the personality and comfort level of the client because what may be simple to some, may be heavy for others. Party Makeup is tricky because judging a client's expectation in such a situation is difficult. There are people who show super glamorous makeup and say we want this kind of light makeup. Party makeup is any amount of makeup done on a client. The client who is going for a celebration of some kind like it could be your friend's wedding or your child's birthday party or a bachelor party etc. There is no simple or heavy party makeup. It is just a makeup for an occasion where you are a part of the celebration and not the center of attraction. So, the makeup has to be done according to what occasion it is. What's your role in it but my job as a Makeup Artist is to make you look attractive and the best version of you. In this makeup, you may use more creativity on eyes, its look may be good and stunning.

Bridal makeup (Fig 19) : Bridal makeup is an essential part of the wedding planning process and designing the perfect look for your wedding day. This is by far the most desired look for brides as it just enhances your natural beauty with soft washes of color in neutral tones. It is nothing but the heavy makeup which is done for the bride on her wedding. Brides prefer the best beauticians for their bridal makeup in order to look appealing on their big day. It is done for a minimum of three hours by using high quality, full coverage and long lasting cosmetic products to improve the look and feel of the bride. Along with the makeup, suitable jewellery and costume are also worn by the bride which makes the look perfect and complete. The lipstick and eye shadow colour is kept bold rather than vibrant, nude or natural. Purpose of bridal makeup is to get perfect photograph of bride for each and every expression.

Fig 19

CTM routine

A CTM routine basically stands for cleansing, toning and moisturising and is an extremely trusted beauty routine. It is a base for clear, radiant and glowing skin. This is a simplified yet effective regimen that starts with washing your face with a cleanser to remove dirt and impurities. It's then followed by toning to recoup the natural pH level of the skin. And finally, it's topped with a moisturiser to keep the skin hydrated for really long. To really strengthen this routine one also needs to go in with sunscreen so that the skin is protected from the harmful UVA and UVB rays of the sun. However, it's crucial for your skin radiance, health and freshness to not only follow it daily but also follow it twice a day. The first should be done in the morning and the second right before going to bed.

Benefits of CTM routine

- 1 **It cleanses the skin thoroughly:** Throughout the day dirt, makeup, debris, impurities and pollutants seep into your pores. So after a long day, it's important to cleanse your skin thoroughly so that it's able to breathe and so that your pores open up. Similarly, through the

night, dead cells gather on your skin and so when you wake up, it's really important to keep it clean. Otherwise, imagine how dirty and tired it would look! One thing to note is to pick a good quality cleanser without any sulphates, parabens, mineral oil or alcohol because these could strip away the natural, healthy oils that your skin produces, leaving it dry and prone to wrinkles.

- 2 **It tightens your pores:** That Are Left Open During Cleansing - Apart from cleaning the skin deeply, the toning part of the CTM routine helps in tightening the pores that have been left open during cleansing. If these pores are just left open dirt and dead skin cells would basically clog them again. Clogged pores lead to acne, blackheads and spots. So, using a toner acts as an astringent and tightens the pores and creates a protective barrier.
- 3 **Keeps the skin's pH levels in check:** If you don't know what a pH level is, it's basically the acidity or alkalinity level of anything. Skin has a slightly acidic pH level that gets dis balanced when alkaline products are used like cleansers and face washes. This is harmful because alkaline skin can breed more skin infections. Hence, using a toner in your CTM routine is important.
- 4 **Replenishes the skin's moisture:** After cleaning it and toning it, the next step is to moisturise. Giving the skin the much needed boost of vitamins, essential fatty acids and antioxidants is crucial. So for smooth and supple skin, loading on moisturiser is key. (Fig 20)

Fig 20

- 5 **Delays visible signs of ageing :** Everyone wants youthful skin and when you follow the cleansing toning and moisturising regime then you can delay signs of aging like wrinkles, spots, crows feet around the eyes etc. Because it's keeping it clean and keeping impurities at bay, maintaining the pH balance of the skin, and moisturising it and keeping it nourished.

Basic corrective makeup

Corrective makeup is a technique that makes use of light and dark shades and colors to highlight and contour our features, creating the illusion of better balance and proportion. For instance, you can use corrective techniques to make a narrow top lip appear to be fuller, and to work with unequal eyebrows to give them a more symmetrical

appearance. The term corrective makeup is sometimes confused with the term camouflage makeup, which is applied to conceal scars, hyperpigmented (darker) areas and other features that a person wishes to hide. It helps to highlight attractive features while minimizing features that are out of proportion or unattractive in relation to the rest of the face. Corrective Makeup is used to erase, or "correct," any blemishes, scars or facial imperfections that may be distracting to the audience or simply just don't fit with the character the actor is portraying.

One of the most rewarding aspects as a makeup artist is teaching people how to create an illusion using the magic of makeup to make them feel more confident about themselves. When conducting a makeup "illusion" session, it includes correction makeup, and colour correction makeup techniques. Like any art form, covering up or camouflaging skin imperfections takes practice and patience. Some of the most common skin conditions for covering up and or camouflaging include - Acne, scars, burns, vitiligo, pigmentation, rosacea, age spots, birthmarks and dark eye circles.

The art of covering up imperfections can be achieved in many ways, with precision and lots of blending. Corrective makeup is a technique that makes use of light and dark shades and colours to highlight and contour features, creating the effect of balance and proportion. Dark shades always appear further away and lighter shades appear closer. By using dark and light shades in the right place next to one another you can create an illusion of shape.

A highlight, (light shade) will emphasize a feature and contouring, (dark shade) will minimize a feature, making it less noticeable. A light colour brings an object forward and a dark colour will bring back to the foreground. Contouring will create a shadow, the shadows will help define certain areas. Highlighting will bring light to the face and make the features more prominent, bringing them forward to the eye. You can use the contour and highlight technique for the following areas; a lips, a wide nose, cheek bones, a round face, a long face, wide jaw, double chin and the eyes, wherever you feel the need to emphasize or hide a feature. (Fig 21)

Fig 21

Makeup removal : Anyone who wears makeup knows that removing it can be the worst part, until you find the

right makeup remover (i.e. one that won't sting your eyes yet will remove all traces of makeup). It's important to know that cleansing your skin and removing your makeup are not the same thing. When it comes to removing eye makeup in particular, the slower you go, the better.

Apply makeup remover and let it sit, and sit some more. Give it a couple minutes, say, while you brush and floss. This will soften mascara, liner, and shadow so it slips off easily and thoroughly once you finally wipe. If you do this, you won't find smudges under your eyes in the morning any more. Giving remover time to work its magic also prevents you from having to rub/scrub with your makeup-remover pad-always a mistake, since friction can damage the delicate skin around your eyes, causing irritation and contributing to wrinkles.

Make sure to cleanse the edges of your eyelid. Soap and water works better than makeup wipes. Wipes can be an excellent initial step in removing makeup-in fact, they're best used to remove makeup before cleansing. Many of us make the mistake of just using wipes and going to bed, but the makeup really is not all off, you still have to wash your face. Using water and face wash is what's really going to remove residue and prep your skin for a good night. If you use only wipes and then apply moisturizer, you might push dirt into your pores and wake up with pimples or black heads. Use a cleanser made to remove make up. Flat cotton pads are better than cotton balls for removing makeup.

Cotton balls can leave behind residue or break down during usage and leave fibers on your lashes or skin. That can lead to irritation at a time when you're trying to detox and soothe. Always opt for flat cotton pads instead of balls, ideally with a quilted texture. (Figs 22 & 23)

Fig 22

Tools & equipment hygiene : Makeup is a beautiful thing, but germs have no place in your makeup bag. Clients will be impressed with clean and sleek looking makeup products when they sit down in your makeup chair. When you maintain your makeup kit to keep it clean and hygienic, you will notice that the process doesn't take very long. Maintaining your makeup kit is an essential

aspect of owning makeup and wearing it, whether you're a professional makeup artist or you simply maintain a makeup kit for your own use. Look at it this way, you don't want to put dirty, unhygienic products on your beautifully clean skin or a client's.

Fig 23

Maintaining your makeup kit and ensuring that all products within it are properly sanitized will ensure a beautiful (and hygienic) makeup application each and every time. Brushes should be kept clean and free of foundation and eye shadow debris. While it may not always be realistic to have clean brushes 100% of the time, it should be a priority. Whether you are a professional makeup artist or an individual who only applies makeup to yourself, clean brushes will keep acne and breakouts at bay because it is much more hygienic. Keep a brush cleanser in your kit as well and spray it on brushes for a quick cleanse. If you don't have a brush cleaning kit, you can also use paper towels to blot your makeup brushes and remove excess makeup within the bristles.

Deep cleanse brushes at a sink by using cool or lukewarm water to wet the brush. Then swirl the brush in the palm of your hand with water and brush cleaner. Rinse until the brush runs clean. Lay brushes flat on a counter top with the end of the brushes exposed to the open air. This will allow them to air dry and prevent buildup within the bristles. Makeup sponges must be left out to air dry or mold can grow within them. Using disposable applicators and sponges, which can be discarded after a few uses are also a great idea. It's also a good idea to wipe down products at least once a week. You can do this with a packet of cleaning cloths that kills and disinfects germs. You may even wish to keep a packet of these in your kit at all times to have them handy. A paper towel and a bit of alcohol also go a long way in removing germs from products. Wipe down all packaging of products along with the inside of palettes with alcohol and a paper towel. This process will also keep your makeup products looking clean and professional. If you are a professional makeup artist, dirty looking palettes and kits may send off an unprofessional image.

Getting in the habit of using these techniques to keep all of your tools and makeup clean will go a long way. Wipe off your eyeliner pencil with alcohol on a fuzz-free cotton pad (found near the cotton balls at your drugstore); with alcohol, it will dry quickly and stay sterile. Don't use the eyeliner on the moist, pink part of your eyelids. Most eyeliners are not designed to be used there nor close to your tear ducts (the inner corner of your eye). Use a brush or spatula and palette. Don't touch foundation, lipstick & eye shadow with your fingers. To clean the curler, wet a cotton pad or ball with rubbing alcohol or hydrogen peroxide and wipe down all the surfaces that come in contact with your eyes. Simply dip an old toothbrush into some rubbing alcohol or hydrogen peroxide and carefully get into the edges of the sharpener. Rinse well with cool water and allow to air dry.

Clean your makeup brushes in 8 easy steps

- 1 Wet the bristles thoroughly with warm water.
- 2 Place a drop of your makeup brush cleanser into the palm of your hand.
- 3 Gently massage the tips of the bristles using a swirling motion. (Fig 24)

Fig 24

- 4 Rinse the bristles with warm water.
- 5 Disinfect your brushes by swirling them around for two minutes in a bowl with two parts water and one part vinegar. Be careful to not submerge any part of the ferrule or handle.
- 6 Gently squeeze out excess moisture with a clean towel.
- 7 Reshape the brush head by gently shaping the bristles from the base to the brush tips.
- 8 Dry the brush with its bristles hanging off the edge of a counter so they maintain their shape. Never let your brushes dry on a towel—that's how they end up mildewed.

Safety precautions

Always remove eye makeup before bedtime. This is one of the most important eye makeup safety tips. Mascara can stick to the lashes, clog up tear ducts or flake off into your eyes. As mentioned earlier, always be gentle with your eyelashes and the skin around your eyes. Gently

remove eye makeup using a soft touch, in other words avoid vigorous scrubbing or scraping.

Use mild eye makeup removers like a cleanser formulated for around the eyes. You can use Vaseline, or baby shampoo to remove cosmetics around the eyes. Be careful not to get the cleanser in your eyes. And thoroughly rinse the residue off. If you don't thoroughly remove your makeup before going to bed, you can irritate skin, clog pores, and cause acne inflammation and redness.

Be wary of harsh makeup removers containing alcohol if you have sensitive skin, and cleansers containing alpha hydroxy acids might be too strong to use around the eye area. To speed the cleansing process along, wet your hands and apply a non-foaming cleanser to dry skin. This will ensure the product latches onto makeup, dirt, and oil on the skin, giving you better cleansing.

General tips

- 1 Follow safety guidelines when using cosmetics products of any type.
- 2 Read the label. Follow all directions and heed all warnings. (Fig 25)

- 3 Wash your hands before you use the product.
- 4 Do not share makeup.
- 5 Keep the containers clean and tightly closed when not in use, and protect them from temperature extremes.
- 6 Throw away cosmetics if there are changes in color or smell.

- 7 Do not use cosmetics near your eyes unless they are meant for your eyes. For example, do not use lip liner on your eyes.
- 8 Do not add saliva or water to mascara. You could add germs.
- 8 Throw away your eye makeup if you get an eye infection. The makeup could have become contaminated.
- 10 Do not dye or tint your eyelashes.
- 11 Products must be tested for safety and must have an expiration date printed on the packaging.
- 12 How long cosmetics will remain safe to use and effective depends on how often you use them, how they're packaged, how they're stored and the type of makeup. Products used for the eyes, like mascara, have a shorter shelf life because they are exposed to more bacteria and fungi.
- 13 As soon as makeup is exposed to air, it begins to degrade. Many other factors also cause cosmetics to break down. Examples include: Using your fingers to apply makeup can introduce bacteria, mold and yeast to the container. Mascara applicators are exposed to bacteria every time you use them.
- 14 Exposure to sunlight and changing temperatures can cause changes in texture, color and smell of cosmetics.
- 15 Keep applicators and brushes clean.
- 16 If you have a cold sore, shave off a layer of lipstick and lip liner to prevent reinfection.
- 17 Never use used sponges on any client.
- 18 Expired mascara often smells funny, so smell your mascara when you first open it so that you can recognize any changes.
- 19 Never use old applicators for new makeup. You may like a certain applicator that came with an old tube of mascara or an eye shadow better than the applicator that accompanies its replacement. Don't be tempted to keep that old applicator! Bacteria can grow and accumulate on applicators, so it is important to regularly replace applicators as well as make-up.
- 20 Always use products as per client's skin type.

Hair styling

Objectives : At the end of this lesson you shall be to

- **describe the purpose of hair styling**
- **state the principles of hair styling**
- **explain the knowledge of equipments and cosmetics used in styling**
- **describe the types of hair styling.**

Describe the purpose of hair styling

Hair styling is the art of molding, shaping and forming hair into a fixed pattern. Hairstyling skills will help you clients to be as trendy as they want them to be, allowing them to keep up with new trends.

State the principles of hair styling

Some principles of hair styling used for the best result in styling

- 1 Individual status:** Height, size and shape of person should be considered before choosing a style. A big large and heavy hair style will not look good on thin, small persons.
- 2 The shape of head:** The ideal face shape considered is the oval. But six basic shapes known by the beautician - square, round, Triangular, inverted triangular, Oblong and diamond.
- 3 Hair quality:** The quality of hair is a determining, how hair it will be perform. The performance of hair is depends upon its texture, density, length.
 - i Texture & density:** Hair texture can be classified by its surface- Very fine, fine, medium or coarse texture. The density of hair is the hair is thin, medium, or thick with any of four textures.
 - ii Length:** Hair length is important to hair performance. In dressing longer hair, it takes

more hair to go around a large size roller then to go around a small size roller.

iii Hair condition: The condition of hair is an important factor to be considering before styling. Hair that is weak and dry will tend to break, will have split ends or may be very frazzled. That type of hair is difficult to styling, but not impossible.

iv Hair growth pattern: Hair growth is an important part in hair styling. Hair growth pattern means natural angle and direction of hair growth. These are quite strong and cannot be changed. A hair growth pattern is effect only a small part of the hair. These are called cowlicks, whorls, windows peak or double crown.

- **Cowlicks:** Cowlicks are portion of the hair that grow to the left or right and can usually be found in straight or wavy hair. Cowlicks should be cut following direction the hair naturally falls.
- **Windows peak:** A Windows peak is hair that forms a point at the hair line at the top of the forehead.
- **Whorl:** Whorl is section of hair that grows in a circular pattern, it's commonly seen at the nape or the crown.
- **Double crown:** Double crown are two area of hair close to each other that have hair growing in opposite directions.

Explain the knowledge of equipments and cosmetics used in styling

- 1 Hair spray:** Hair spray used to set the hair style after a comb out or blow dry.
- 2 Hair brush:** Brushes are made of bristles the bristles are embedded in a plastic or wooden base. Brushes help to remove tangles and knots.
- 3 Combs:** Combs are mainly used for detangling the hair.
- 4 Tail comb:** A small comb with evenly spaced teeth & tail at one end. It is used to part the hair into sections.
- 5 Bob pins:** These pins have a smooth and crimped pattern. Smooth pins are best for pinning rollers and curls & controlling the hair shaping. The crimped pins are used for pinning long hair.
- 6 Setting lotion:** Setting lotion is available in liquid form. The selection of the setting lotion depends on the type, quality and texture of hair.
- 7 Serums:** Serums are made from oils and silicones, they improve shine and soften the hair by forming a tiny film.
- 8 Crimpers:** Crimper has two ridged metal plates and produce same patterned crimps in straight lines in the hair. Mainly crimps are used to give waves the hair.
- 9 Hand dryer:** Dryers come in different range of heat & speed. It's used for drying and styling the hair. It can also be used to temporarily straighten and curling the hair.
- 10 Diffuser:** Diffuser is a special attachment for the blow dryer. The air is direct over a wide area of the head, and the hair dries naturally without any loss of curl.
- 11 Hot rollers:** Hot rollers are electrically heated rollers that come in a variety of sizes. Hot rollers are rarely used.
- 12 Curling iron:** Curling iron having a barrel prong and a depressor groove. Curling iron is available in different sizes. It is used depends on small, medium, or large curls.
- 13 Strengtheners:** Strengtheners are based on the same principle as crimpers but have flat plates to iron curly or frizzy hair.
- 14 Finger waving comb:** A 7 inch styling comb with teeth that will slide easily through the hair, moving scalp hair.
- 15 Style comb:** A large comb used for backcombing the hair. It helps to easily control the hair.
- 16 Single or double prong clips:** These pins are used to hold the pin curls.
- 17 Rollers:** It's available in various size & length.
- 18 Gel:** Gel applied to the ends and root area to create maximum control of the hair.

Describe the types of hair styling

There are two basic methods of hair styling. The first method is traditional, it includes both wet and dry styling. And the second method is thermal styling.

1 Traditional styling:

- a Dry method:**
 - Rolls
 - Inter locks
 - Artificial aids
- b Wet method:**
 - Pin curls
 - Finger waving
 - Roller setting

- The second method is thermal styling. It involves setting the hair by electric equipments or heat.

Wet method

Pin curls : Pin curls are used on the head to create a variety of hair styles. (Fig 1 & 2)

Fig 1

Parts of a curl
Base
Stem
Circle

Fig 2

No-stem curl
Half stem curl
Full stem curl

Mobility of a curl

1 Parts of curls: Three parts of a pin curl

- Base:** The part of the pin curl that is firmly attached to the scalp.
- Stem:** The part of the pin curl that is located between the base and the first arc of the circle; allows for direction and mobility of the curl.
- Circle:** the parts of the pin curls that forms the complete circle or curl; decide the size of the wave or curl.

2 Pin curls bases & foundations (Fig 3)

Fig 3

Pin Curl Bases and Foundations

- Square Base- curly styles: no vol.
- Rectangle- upsweep effect usually on side area
- Arc-half moon or C shape:nape area
- Triangle -front facial- prevents splits or breaks

- **Square base:** curly styles- no volume
- **Rectangle base:** Up sweep effect usually on side area
- **Triangle:** Front facial prevents splits or breaks
- **Arc- Half moon or c- shape:** Nape area

3 Types of curls (Fig 4)

Fig 4

There are many different types of curls. They may be used for firmness on the hair.

- I **Fill in curls:** Fill in curls is used in the areas between shaping the face and run around the crown. The hair between these shaping is straight.
- II **Skip wave:** Skip wave is a hair style that combination of pin curls and finger wave.
- III **Sculptured curl or curved curl:** Pin curl sliced from a shaping and formed without lifting the hair from the head, is called sculptured curl.
- IV **Cascade or stand up curls:** It is used to create height in the hair style and gives to more volume.

4 Pin curls techniques (Fig 5)

- I **Ribboning:** Ribboning is involves forcing the hair between the thumb and back of the comb to create tension. you can also ribboning the hair by pulling the strands while applying pressure between your thumb and index finger out toward the ends of the strands.
- **Finger waving (Fig 6 & 7) :** Finger waving is a method of moulding the hair into S- shaped movements with the hands, fingers and comb. It is also called water waving or setting. The effects

produced are temporary. A finger-waved head of hair was in the past an accepted and popular style or fashion, but now the technique is used as part of a style in training hairdressers and in some competitions and displays. Apart from the effect produced, mastery of the technique achieves the following:

Fig 5

Fig 6

Fig 7

- a an appreciation of wave shape - the basis of styling
- b control of hands, comb and hair
- c exercise for the muscles of hands, arms, back and body
- d gaining self discipline, so essential for the successful professional hairdresser.

Finger wave is the method of setting hair into waves (curls) that was popular in the 1920s & 1930s and in the late 1990s in the North America and Europe. The process involves pinching the hair between the fingers

and combing the hair in alternating directions to make a wave shape. Finger waving are similar to the Marcel wave in appearance. This hairstyle should last between one to two weeks with proper care. These finger waves with color hairstyle are incredibly easy to maintain.

- **Roller setting (Fig 8)**

Fig 8

Curly hair styles are always popular. There are many ways to curl your hair. A wide range of rollers including hard plastic, foam and wire rollers. Rollers also come in a variety of sizes. A hair roller is a small tube that is rolled into a hair in order to curl it, making a new hairstyle. The diameter of the roller varies from approximately 0.8 inches (20mm) to 1.5 inches (38mm). The hair is heated or wet; the rollers break the hydrogen bonds in the cortex layer, which causes the hair to curl. The hydrogen bonds reform after the hair is moistened.

- **Parts of rollers curl**

- 1 **The Base:** The part on which the roller is placed. The base should be the same length and width as the roller.
- 2 **The Stem:** Hair between the scalp and first turn of roller. The stem gives the hair direction and mobility.
- 3 **The Circle:** The hair that is wrapped around the roller. It decides the size of the curl.

- **Selection of roller size**

The relationship between the length of hair and the size of roller will decide whether the result will be a curl.

Roller size + Length of hair = Curl Result

Types of rollers

- 1 **Magnetic/ plastic roller:** These rollers are hard plastic cylinders with ventilation holes that are called magnets. So, they can be used to wrap your wet curls without any styling products. (Fig 9)
- 2 **Velcro rollers:** Velcro rollers are used on dry hair only. A Velcro roller is made of a strip of hook and loop fasteners that is wrapped around cylinders. They are available in different sizes and can be used on dry or wet hair. The rollers are self-holding because they do not need pins or clips. (Fig 10)

Fig 9

Fig 10

- 3 **Flexi rollers/ benders:** The Flexi rods hair rollers are very flexible and they are referred to as bendy rollers as well. These hair rollers have been around for a very long time, they are quite suitable for all hair types, and with the use of Flexi rollers, you can easily create a beautiful style without using direct heat on your hair. (Fig 11)

Fig 11

- 4 **Foam rollers:** The sponge hair rollers are another important hair curler every woman should know. It is the perfect roller if you want to preserve your curly styles overnight as you can easily sleep with them in your hair. There is a curling method you can use to get your kind of curls with these rollers and they are more comfortable than other curlers. (Fig 12)

Dry method

- **Artificial aids:** Artificial aids served to improve women's beauty. People choose to wear artificial aids for some reasons mostly for convenience and a quick change of style. (Fig 13)

Fig 12

Fig 13

Artificial aids are worn for three principles reasons

- 1 **Necessity:** To cover up baldness and damaged hair.
- 2 **Fashion:** For changes in everyday hair style, for decorative purpose, and for special occasions.
- 3 **Practicality:** For quick changes in hair shades and style to accommodate the busy women.

Construction of hair pieces : Artificial aids can be made from Human hair, synthetic and animal hair, or a blend both.

A simple match test will tell the difference between human hair and synthetic hair. Cut a small piece of hair from the back area of the hair piece. With lighted match, burn this hair strand and observe these points:

- 1 Human hair burn slowly and gives off a strong order.
- 2 Synthetic hair burn quickly and gives off little or no order. All the hair pieces can be made by machine or by hand. The machine made hair pieces are less expensive. However, hand knotted hair pieces are the most natural looking.

Types of hair pieces

A variety of hair styles can be created with hair pieces that can be dressed for either day time or evening wear. Hair pieces come in many shapes, sizes, styles and color.

- 1 **Wiglets:** Wiglets are small hair piece. It contains about 1 ½ ounces of hair that is 5 to 7 inches long. (Fig 14)

Fig 14

- 2 **Falls:** Longer hair look can be achieved by using a falls. Falls came in several length from 10 to 26 inches. The amount of hair also varies from 5 to 10 ounces. (Fig 15)

Fig 15

- 3 **Switches:** Switch is the long hair piece that is wafted to a small base. There long piece usually used for special styling effects. They are constructed with 1-3 stems of hair. The better switches are constructed with three stems, to provide greater flexibility in styling and braiding. (Fig 16)
- 4 **Toupees:** Hair pieces that are custom designed to fit a man's pattern of baldness are known as toupees. These hair pieces are made to exactly fit the hair less area and are colored match the client remaining hair. (Fig 17)

Cleaning and maintaining of hair pieces

Most people know when their hair needs shampooing, but many do not know when their hair pieces should be cleaned. If the hair piece is worn frequently, it should be cleaned every 2 to 4 weeks. A dirty hair pieces lacks shine.

- 1 **Synthetic hair piece cleaning:** Synthetic hair should be shampooed in cool water with a mild shampoo.

During washing the hair piece care should be taken that the wig is not rubbed, but use your fingers to getting separate the hair strands. To rinse a hair piece use lower pressure and cold water carefully.

Fig.16

Fig.17

Let excess water run from the hair piece, then fold it in half. Fold in half again and gently squeeze. Unfold the hair piece to half and lay the hair piece on a towel and press out excess water gently. Remove the towel and shake the hair piece gently and set the hair piece according to style.

- 2 **Human hair piece cleaning:** Human hair can be clean with acid balanced shampoos they specially design for chemically treated hair. Some makers advise that human hair pieces be cleaned with special cleanser. Always wear gloves and work in a well ventilated place.

Thermal styling : Thermal styling is method of waving and curling, straight or pressed hair using thermal equipments on dry hair. Thermal equipment is used to.

- i Style and dry the hair
- ii Curl or wave the hair
- iii Straighten the hair

Equipments used in thermal styling

- 1 **Crimpers:** Crimper has two ridged metal plates and produce same patterned crimps in straight lines in the hair. Mainly crimps are used to give waves the hair. (Fig 18)

Fig.18

- 2 **Hand dryer:** Dryers comes in different range of heat & speed. It's used for drying and styling the hair. It can also be used to temporary straighten and curling the hair. (Fig 19)

Fig.19

- 3 **Diffuser:** Diffuser is a special attachment for the blow dryer. The air is direct over a wide area of the head, and the hair dries naturally without any loss of curl. (Fig 20)

Fig.20

- 4 **Hot rollers:** Hot rollers are electrically heated rollers that come in a variety of sizes. Hot rollers are rarely used. (Fig 21)

Fig 21

- 5 **Curling iron:** Curling iron having a barrel prong and a depressor groove. Curling iron is available in different sizes. It is used depends on small, medium, or large curls. (Fig 22)

Fig 22

- 6 **Strengtheners:** Strengtheners are based on the same principle as crimpers but have flat plates to iron curly or frizzy hair. (Fig 23)

Fig 23

Blow drying

A Blow drying is a method of styling the hair while drying it with a hand held hair dryer. Blow drying involves using the hot air from the dryer and a brush to mold the hair. A blow dryer can also be used to temporary straighten curly and wavy hair.

Hair iron

A hair iron or hair tong is a tool used to change the structure of the hair using heat. There are three types of irons;

- I **Curling irons:** Curling iron used to make the hair curly. Curling iron is constructed of two parts- The groove and the prong. The prong is the solid part and is round shaped. The groove is empty or curved to fit around the prong when iron is closed.
- II **Straightening irons:** straightening iron is commonly called straighteners or flat irons and that's used to straighten the hair.
- III **Crimping irons:** Crimping iron is used to create crimps (Waves) of the desired size in the hair. Crimper gives pointed ridges in the style. Crimping iron come in different sizes with different sized ridges on the paddles. Large ridges produce large crimp in the hair and smaller ridges produce smaller crimp.

Safety precautions while doing thermal hair styling

- 1 Handle thermal equipments carefully to avoid burning yourself or the client.
- 2 Do not use comb with broken teeth. They can break or split the hair or injure the scalp.
- 3 The client hair must be clean and completely dry to ensure a good thermal curl or wave.
- 4 Do not use thermal equipment on chemically treated hair because they might cause damage to the hair.
- 5 If the hair is thick or bulky, thin and taper it first.
- 6 Read the warnings and instructions for your hair dryer before use.
- 7 Set the hair dryer to the desired setting—often low, medium or high.
- 8 Plug the hair dryer into a grounded outlet.
- 9 Run the hair dryer over your hair, keeping it a safe distance from your scalp to avoid burning. Keep the plug away from hot surfaces while in use.
- 10 Unplug the hair dryer when you are done using it. Store it in a dry cabinet or storage space where it cannot fall or be pulled into a bathtub or sink.

Hair coloring /knowledge of hair colouring

Objectives : At the end of this lesson you shall be to

- define knowledge of hair structure
- explain about hair shaft and hair root.

Introduction of hair coloring

Color is dynamic. It can be used to express personality, mood, fashion, and time. Hair coloring, or hair dyeing, is the practice of changing the hair color. The main reasons for this are cosmetic: to cover gray or white hair, to change to a color regarded as more fashionable or desirable, or to restore the original hair color after it has been discolored by hairdressing processes or sun bleaching.

Knowledge of hair structure

- 1 Hair is an appendage of the skin. Hair offers protection to your body, helps you to look attractive, and plays a big part in supporting the billion-dollar cosmetic industry of which you have decided to become a part. The scientific study of hair is called trichology.
- 2 Hair is composed mainly of a hard chemical substance called keratin.
- 3 Keratin, which is a protein, is also present in our nails and in the claws, feathers, hooves and wool in animal.
- 4 Hair contains varying amounts of carbon, hydrogen, oxygen, nitrogen, and sulphur.
- 5 Light hair has more oxygen and sulphur, whereas dark hair has more carbon and hydrogen.

Chemical Composition of Hair

- Carbon 45%
- Hydrogen 6.7%
- Nitrogen 15%
- Sulphur 5.3%
- Oxygen 28%

Structure of hair : There are two main divisions of the hair, one above the surface of the skin and one below it (Fig 1).

- The portion of the hair that we are usually most concerned about is called the Hair shaft.
- This is the part of the hair that we see sticking out from the skin. The hair root is the portion that is below the skin.

Hair Shaft (Fig 2)

- The appendage that projects from the epidermis is known as the hair shaft. The hair shaft is comprised of three layers: the cuticle, cortex, and medulla.

Fig 1

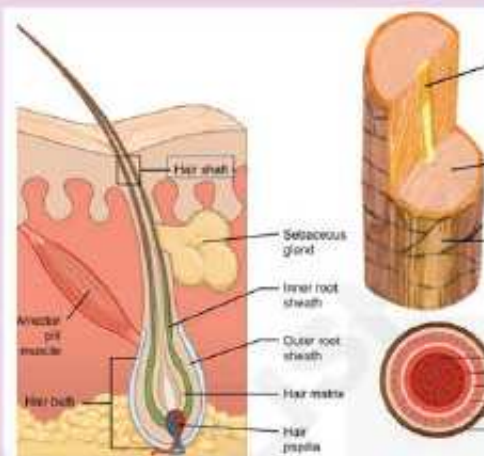

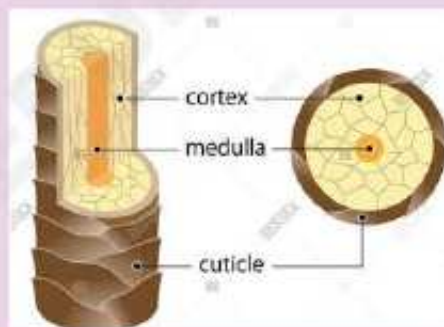

Fig 2

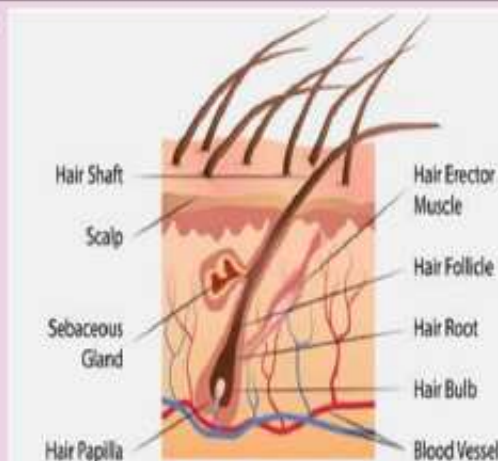

- The cuticle is the hair's outer most layer which has shingle or scale like cells that overlap. These cells work defensively to prevent damage to the hair's inner structure and to control water content of hair fiber. The middle structure includes the cortex which provides strength, color and texture of the hair. The innermost structure is the medulla layer which is only present in large thick hairs. The shingle like cells of the cuticle layer point toward the ends of the hair and are raised during chemical processes. When the cells are raised, solutions are able to enter into the cortex layer.
- The middle layer of the hair is known as the cortex, and it has many different functions. Approximately 90 percent of hair's total weight lies within the cortex layer. Elongated cells form a fibrous substance that gives strength and elasticity to the hair. The cortex also houses the pigment (melanin) that gives hair its natural color. Services such as chemical hair relaxing, thermal styling, wet setting and hair coloring oxidation cause temporary and permanent changes to the hair. These changes take place in the cortex layer.

The cortex also houses the pigment (melanin) that gives hair its natural color. Services such as chemical hair relaxing, thermal styling, wet setting and hair coloring oxidation cause temporary and permanent changes to the hair. These changes take place in the cortex layer. There are two types of melanin that can be found in the cortex layer of the hair: eumelanin and pheomelanin. Eumelanin produces brown and black color, and is the most prevalent type of melanin.

Pheomelanin imparts yellow, blonde, red and auburn hues. Natural hair color derives from a pheomelanin and eumelanin ratio combined with the size and number of pigment granules. When hair is gray, there is an absence of melanin pigment in the cortex layer. **Medulla Layer:** The medulla, also referred to as the pith or marrow of the hair, is the innermost layer. Composed of round cells, this layer is normally found in thick and/or coarse hair. Naturally blonde and fine hair generally does not have a medulla. The function of this layer of hair does not affect the hair care services conducted by salon professionals.

Hair root: A variety of structures are connected with the hair root (Fig 3).

Fig 3

Hair follicle: The hair follicle is a tiny tube like pit in the skin. The follicle is like a test tube that holds the hair root. Every hair on your body has its own follicle.

Hair bulb: The hair bulb lies just above the papilla and fits over it tightly. The hair bulb is nourished by the papilla.

Arrector pili muscle: The Arrector pili muscle, which we mentioned earlier, is attached to the lower portion of the follicle.

Science of color

Objectives : At the end of this lesson you shall be to

- define science of color
- natural pigment of hair color
- natural hair changes color.

Introduction about science of color

- Color theory is both the science and art of using color. It explains how humans perceive color; and the visual effects of how colors mix, match or contrast with each other. Color theory also involves the messages colors communicate; and the methods used to replicate color.
- Color theory will help you build your brand.
- Color is perception. Our eyes see something (the sky, for example), and data sent from our eyes to our brains tells us it's a certain color (blue). Objects reflect light in different combinations of wavelengths. Our brains pick up on those wavelength combinations and translate them into the phenomenon we call color.

Natural pigmentation of hair : Color is formed in the cortex of the hair by melanocytes which produce two types of pigment: melanin's, which are black/brown, and pheomelanin's, which are red/yellow. All- natural hair color are a combination of these two types of pigment.

Dark-haired people have more black/brown pigments while the fairer-skinned nationalities have more red/ yellow pigment. It is the variation in these pigments that produces the spectrum of different hair colors.

- Eumelanin provides black and brown pigments and, therefore, determines how dark hair is. Furthermore,

when more of this pigment is present in someone's hair, it gives the overall hair colour a cool look, like ash. Eumelanin pigments consist of all three primary colours – blue, red and yellow (Fig 1).

Fig 1

- Pheomelanin provides red and yellow pigments. This gives rise to warmer colours in someone's hair, like auburn, strawberry or gold.

Black and brown hair contains a lot of eumelanin. Red hair has large quantities of pheomelanin. Light blonde hair actually contains relatively little melanin – the pale yellow we see is due to the keratin in the hair, rather than any pigment. White hair contains little or no pigment at all (Fig 2).

Why natural hair changes colour

We can change our hair colour by choice by using hair dyeing products. Here, the various chemical processes in hairdressing (like bleaching, tinting, neutralising) act on the natural pigments to change the hair's colour.

Fig 2

However, hair colour can change for a variety of other reasons that are not always under our control, including:

- Ageing can affect pigment production. Consequently, as we age, melanin stops being made in our hair and, therefore, individual new hairs can grow without pigment. This is why they are white. When white hair is mixed with hair that still has colour, it creates a grey look – sometimes referred to as “salt and pepper”.
- Blonde children can sometimes see their hair darken when they are around seven or eight years old, and

go on to have dark hair in adulthood. The hair darkens as melanin production increases.

- Environmental factors can also impact hair colour. For example, humidity and wind bring more oxygen to hair and this attacks the pigments in the hair. Sunlight can then accelerate the process further. The blue pigments in the hair are the weakest and disappear first. This leaves the warm undertones of red and yellow showing through the hair. Our hair often lightens when on beach holidays due to being exposed more to the combination of sun and wind.
- Health issues can contribute to premature greying. For example, autoimmune thyroid disease, vitiligo, and ageing syndromes can lead to greying hair.
- Medication can alter natural hair colour. For example, certain drugs used to prevent malaria can lighten hair, while some epilepsy drugs can darken it.
- Pregnancy can darken light hair due to higher levels of hormones oestrogen and progesterone.

Basic law of color (Color wheel)

Objectives : At the end of this lesson you shall be to

- describe basic law of color
- describe primary color, secondary color, tertiary color.

Basic law of color

The laws of color regulate the mixing of dyes and pigments to create other color. The first concept of these laws is basic color. Colors are arranged around the color circle in a manner that shows the relationship among color. The circle is divided into four categories: primary, secondary, tertiary and quaternary.

- 1 Primary Color: Red, yellow and blue.
 - 2 Secondary Color: Yellow + Red = Orange, Blue + Yellow = Green, Red + Blue = Violet.
 - 3 Tertiary Color: Red - Orange, Yellow - Green, Blue - Violet, Yellow - Orange, Blue - Green, Red - Violet.
 - 4 Quaternary Color: Quaternary color are all the other combinations of color, including all the color the eye can see.
- 1 Primary color:** All color begins with three primary color: blue, red and yellow. A primary color is an elementary color not obtained by a mixture. Each primary color has certain characteristics. (Fig 1)

Red is the medium primary color. Red gives warmth and provides highlights. Red has a stimulating effect, it excites, and is used for warning. Red color tones are the second to fade, but are much more resistant than blue.

Yellow is the third primary color, and the weakest one. Yellow adds lightness and brightness to a color tone. Yellow advances to the eye, and seems larger than it really is. Yellow is the last pigment to be lost. Yellow reflects light, adds highlights, and shows detail. (Fig 2)

Fig 2

Blue is the dominant primary color. Dominance, means that the properties of blue will add depth, or darkness, to a color tone. Blue is described as cool. Even though blue is the dominant pigment, it is the first to be lost when exposed to sunlight, harsh chemicals, or oxidation (Fig 3).

Secondary color: When you mix two primary colors together, you make a new color called a secondary color.

Fig 1

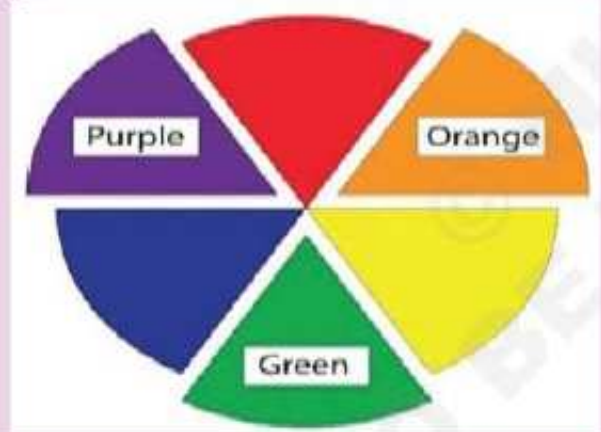

Fig 3

- When you mix primary red and primary yellow, you make the secondary color orange.
- The combination of primary blue and primary yellow make the secondary color green.
- The combination of the primaries red and blue make the secondary color purple (or violet). (Fig 4)

Fig 4

Tertiary color/ complementary color (Fig 5)

- A complementary pair consists of a primary and a secondary color. The secondary color of the complementary pair is a combination of the other two primary colors. Consider yellow.

Classification of hair colour

Objectives : At the end of this lesson you shall be to

- define classification of hair color
- define temporary color
- define semi- permanent color
- define permanent color.

Classification of hair color

Hair coloring is classified according to how long it lasts on the hair. This characteristic, colorfastness, is affected by the product formulation as well as the porosity of the hair. (Fig 1)

Fig 5

- It is a primary color. What are the other two primary colors? Red and blue combine to make the secondary color violet. Violet is the complement of yellow.
- Try green. It is a secondary color. It is made up of primary blue and primary yellow. What's missing? Red. Which is the complement of green.
- What are the other two primaries? What is the complement of blue?

Quaternary color (Fig 6) : Quaternary color are all the other combinations of color, including all the color the eye can see

Fig 6

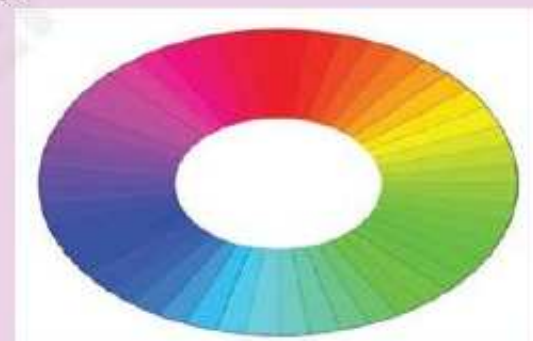

Fig 1

Types of temporary color

- 1 Rinses are prepared with certified colors (colors approved for use by the Food and Drug Administration), water, and usually a mild setting agent. Rinses coat the hair and remain until the hair is shampooed. Color rinses are also available as creams and gels. (Fig 2)

Fig 2

Herbal hair colour tea rinse

- 2 Color Shampoos consist of shampoo mixed with color pigment to blend color tones or neutralize unwanted shades. Many are violet, for example, to neutralize unwanted yellow in white or gray hair. (Fig 3)

Fig 3

- 3 Color sprays-usually bright, party colors- are applied directly to dry hair. (Fig 4)
- 4 Crayons and Mascara are used for facial makeup. Temporary hair color crayons are also used in the theater. (Fig 5)

Use of temporary color

- 1 Toning down unwanted color.
- 2 Adding a different color.

Fig 4

Fig 5

- 3 Blending gray.
- 4 Creating Special temporary effects.

Advantages of temporary color

- 1 Neutralize any unwanted tones in the hair.
- 2 Enhance and add brighter tones to dull hair.
- 3 Correct faded color until the client arranges for a more permanent solution.
- 4 The chief advantage of temporary hair coloring is that it does not alter the structure of the hair, nor does it affect the client's own natural color.
- 5 In most cases, temporary color does not require a patch test.
- 6 Temporary color is quick and easy to apply.
- 7 Temporary Color shampoo easily from the hair.

Disadvantages of temporary color

- 1 It must be reapplied after every shampoo.
- 2 Color results may be uneven, especially if enough rinse is not applied. The color itself will run with moisture or perspiration, will rub off on pillows and clothing, and will flake off when the hair is brushed or combed.
- 3 If the hair is damaged, temporary color will penetrate the hair cuticle layer and uneven color will be evident, after the hair is shampooed.
- 4 Temporary rinses can only deposit color, they cannot lift or lighten color.
- 5 Often hair that is colored in this manner is dull and lacks sheen.

Semi-permanent color : Semi-permanent Color lasts longer than temporary color, yet faded gradually without affecting the natural pigment in the hair. Semi-permanent colors are formulated to last through four to six shampoos and are gradually removed from the hair. (Fig 6)

Fig 6

Traditional semi-permanent color : This type of semi-permanent color work by coating the cuticle and slightly penetrating it. Semi-permanent hair color was first popular in the days of weekly shampoos and sets. Now that many clients shampoo every day, semi-permanent tints have been reformulated to last longer. These new colors are one of the fastest growing categories of hair color today. (Fig 7)

Fig 7

Activated semi/demi-permanent color (Fig 8) : Many semi-permanent colors are mixed with a chemical activator supplied by the manufacturer to make the color effects last longer. These semi-permanent colors bridge the gap between color that washes out with each shampoo and permanent color. When an activator is used, the color molecules are trapped within the cuticle imbrications (or scales) and last longer.

Fig 8

Activated semi-permanent colors are used to blend gray into the natural color, and can also be effective in coloring it.

Translucent semi-permanent color (Fig 9): The last type of semi-permanent color is translucent. This color is applied directly to clean, damp hair and processed under a dryer. The result is a sheer color addition that enhances the client's natural color.

Fig 9

Advantages of semi-permanent color

- 1 Many semi-permanent color do not contain paraphenylenediamine (a color molecule made from coal tar) and are safer to use on clients with sensitive skin and scalp.
- 2 Those that do not require an activator can provide an alternative to permanent hair colors for use on clients during pregnancy.
- 3 The structure of the hair is not affected. Even though some small amounts of swelling may temporarily occur, the interior cortex layer of the hair is not affected.
- 4 Semi-permanent color can be very effective in blending gray hair, and is an especially good way to introduce a client to more permanent methods of hair coloring.
- 5 Semi-permanent color can enhance natural hair color by adding tone and depth.
- 6 These colors are also formulated as toners for pre-lightened hair.

Disadvantages of semi-permanent color

- 1 Limited shades of the older formulas.
- 2 The color is not long lasting unless activated, and may need to be repeated as often as every week, depending on the frequency of shampoos.
- 3 A patch test is necessary on some types of semi-permanent color.
- 4 If the hair is very porous, the effect of semi-permanent color is longer lasting; however, the color often fades to off-shades after several shampoos.
- 5 Semi-permanent hair color rarely provides sufficient coverage on gray hair.
- 6 Semi-permanent color can not lift hair color; it can only deposit pigment.

Permanent color : As the name indicates, permanent color is designed to remain in the hair until it grows out. Both the hair's natural color and the applied color undergo a chemical change. If the color selected is very different from the natural tone, a line of demarcation will be evident as the hair grows out.

Types of hair colour

Objectives : At the end of this lesson you shall be to

- explain types of hair color
- define vegetable tints and oxidation tints.

There are two types of hair color

- 1 Vegetable Tints
- 2 Chemical Tints.

Vegetable tints : Permanent hair coloring is derived from a variety of source. The earliest recorded hair coloring in history is that of staining with plant derivatives. As a coating color, henna was most commonly used, although indigo, sage, and chamomile were also applied. The plant methods are still used today, although they are messy and time consuming. The plant extracts build up on the outside of the hair, and usually preclude any other type of chemical service.

Metallic or mineral dyes : Mineral-based color and compound products. Combines with plant extracts, are another type of permanent color. These agents are never used professionally because the damage to the hair can be quite severe, the range of colors extremely limited, and the hair is left unfit for further chemical service.

If you suspect that your client may have used a metallic color, test the hair before you proceed with a chemical service. Test for metallic salts: Cut off a strand of the colored hair. Place it in a solution of one ounce of 20-volume hydrogen peroxide and 20 drops of 28% ammonia for 30 minutes. Remove the strand from the solution and let it dry. Look for the following reactions.

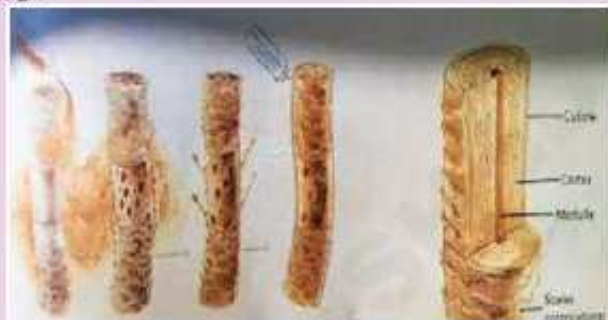

- 1 **Lead-** The strand will lighten as soon as it is placed in the solution. The dry strand will not break when stretched.
- 2 **Silver-** There will be no change in color because the solution can not penetrate the coating. There will be no breakage when stretched.
- 3 **Copper-** the strand and solution will become very hot within a few minutes, and you will detect a disagreeable odor. The strand will break when pulled.

Oxidation tints : The primary ingredient of today's penetrating permanent color is an aniline derivative. These tint molecules, derived from coal tar, combine with the developer to form giant molecules within the cortex layer of the hair. These colors can both lift (make lighter) and deposit (add color) so that the range of shades possible is almost endless. (Fig 1)

There are two types of permanent tints

- 1 Vegetable tints,
- 2 Chemical tints.

Fig 1

Advantages of oxidation tints

- 1 Any natural shade can be duplicated. These colors are permanent, and visible growth requiring a retouch is often not evident for a month or more.
- 2 Tints can lift or deposit so that you can give clients any results they desire.
- 3 Tints can blend or totally cover gray in any percentage.
- 4 The hair is not coated and can receive other chemical services.
- 5 Since the tint penetrates to the cortex layer of the hair, color results appear very natural.

Disadvantages of oxidation tints

- 1 A patch test must be given prior to every application.
- 2 The hair undergoes a chemical change so that the hair must be reconditioned and carefully maintained.
- 3 The natural pigment of the hair is altered. In most cases, the pigment is lifted. Over time, the hair may become brassy.
- 4 In order to remove the effects of a tint, you must use a tint remover (which can also lighten natural pigment), re-tint to camouflage result, or cut the hair to remove the tinted portion.
- 5 The hair color can fade with time and shampooing, to off-color or harsh tones.

Techniques

Objectives : At the end of this lesson you shall be to

- **define techniques**
- **explain pre-lightening techniques**
- **explain global color techniques**
- **explain the high lightening techniques.**

Hair color techniques

Application techniques for hair coloring are unlimited. Most specialty techniques involve coloring only selected strands of hair, rather than the entire head. These techniques can be done alone, or can be performed on colored hair for custom color effect. Partial coloring techniques are recommended for clients who are extremely active, looking for special effects, or inexperienced with hair coloring. Any of these specialty techniques can be used with permanent tint.

Another significant way to vary the results of hair coloring is to change the value of the peroxide. Lower volumes of peroxide (20 volume and below) increase the deposit you can get from a selected color. Higher volumes (20 volume and above) increase the potential lift.

1. Application techniques for hair coloring are unlimited. Most specialty techniques involve coloring only selected strands of hair, rather than the entire head.
2. These techniques can be done alone, or can be performed on colored hair for custom color effects.
3. Partial coloring techniques are recommended for clients who are extremely active, looking for special effects, or inexperienced with hair coloring.

Pre-lightening techniques

- Pre-lightening is the new, professional term for what we used to refer to as 'bleaching'. It is the process of removing natural hair color in order to lighten color all over and is usually followed with a glaze for blonde hair or a color change.
- Pre-lighteners are rarely used on their own without a second color step, toner and glaze, as the resulting effect is a sickly, dull yellow. This can be great for film and TV work. (Fig 1)

Fig 1

Global color techniques: As the name suggests, global refers to coloring your entire hair from root to tip with the same color. Global hair color is popularly used to cover up greys, switch up your hair color and bring uniformity to hair that was previously colored in different hues. During

the global hair color, the product will be applied from the root of your hair to the tips (Fig 2)

Fig 2

High lightening techniques : A hair dyeing techniques in which dye is applied to parts of the hair for a naturally lighter and contrasting appearance.

Highlights are sections of hair are dyed a lighter color. This color variation throughout the hair adds dimension and can accentuate the style of a haircut or the shape of a curl. (Fig 3)

Fig 3

Frosting / cap techniques : The cap techniques, classically called frosting. Strands of hair are pulled through perforated holes in a cap with a hook. The amount of highlighting can be adjusted by using larger or smaller hooks, or pulling hair through holes in predetermined areas only. (Fig 4)

Foil techniques : A foil technique can be used to lighten selected strands of hair or to add subtle color tones to

lightened hair or as a coloring technique. The technique provides many of the same results as the cap technique, but gives you more control over the placement of the lightener or color. (Fig 5)

Fig 4

Fig 5

Weaving : Weaving uses strips of foil, paper, or transparent plastic to control placement of color or lightener on alternating strands of hair. These strips are commercially available, but you may prefer to make your own. The weave techniques also places the lightener or color with the finished style in mind. (Fig 6)

Fig 6

Slicing : Slicing is another foil technique, similar to the weave. The result is slightly more chunky than foiling, so the amount of lift should be only a few shades lighter than the client's natural color. (Fig 7)

Painting: Painting is another fun way to create highlights. With this technique, a color brush or an artist brush is

used to apply thin lines of lightener to dry pre styled hair. Use your artistry to accentuate the crest of a wave, to work very thin strips of lightener through the front, or to accent the uplift at the sides.

Fig 7

Choose the painting techniques when you want subtle results with low maintenance. Select your formula so that the painted hair will be no more than two shades darker or lighter than the rest of the hair. (Fig 8)

Fig 8

Scrunching : Scrunching is an alternative techniques to painting, more suitable to curly or textured hair. Apply lightener to your gloved hands and scrunch the surface and the ends of the hair. You can control the amount of product placed on the hair by applying it to the palms of your hands or to the fingers only. (Fig 9)

Fig 9

Comb technique: There are various special application tools available that are used to comb color or lightener onto the hair. You may also use a convention alwide-tooth comb or rake for this technique. Pre style the hair and carefully plan where you will place the lightener. Dip the applicator into the lightener or place lightener at the base of the teeth with the color brush or bottle. (Fig 10)

Fig 10

Numbering system

Objectives : At the end of this lesson you shall be to

- define color level/value
- numbering system of hair color
- explain the effects of light on color
- the effects of artificial light on hair color.

Color level / value : In hair coloring, Depth is described by the level of the color. The darkest level is 1, and depending upon the manufacturer of the color you use, either 10 or 12 is the lightest level. (Fig 1)

Numbering system of hair color : The International Coloring system, offers a system of defining hair colors. Shades are divided and numbered like this.

Fig 1

Depth	Tone
1/0 Blue- Black	/0 Natural
2/0 Black	/1 Ash
3/0 Dark Brown	/2 Cool Ash
4/0 Medium Brown	/3 Honey Gold
5/0 Light Brown	/4 Red
6/0 Dark Blonde	/5 Purple
7/0 Medium Blonde	/6 Violet
8/0 Light Blonde	/7 Brunette
9/0 Very Light Blonde	/8 Pearl Ash
10/0 Extra Light Blonde	/9 Soft Ash

Therefore a color which has the number 6/1 is the depth of dark blonde with ash tones, so it will be dark ash blonde.

The Effect of light On color : Most color work is done in the salon under artificial lighting. The truest test of colors is always natural daylight- what artists call north light- not direct sunlight. The best time of day to get this true color is between 11:00 A.M. and 3:00 P.M., depending upon the season. Direct sun casts a golden light that intensifies color and changes its tonality, increasing the warmth. It is important to have lighting in the salon as close to natural light as possible so that you can accurately analyze results.

Effects of artificial light on hair color

- 1 Type of light
- 2 Color series

Color Series	Fluorescent	Incandescent
Ash	Ash colors appear more drab than they really are. Your ash color may not be as ash as you want. Ash blonde colors may take on a greenish tone.	The bluish tones of ash colors are neutralized. Ash colors appear less drab. If the color is not ash enough, the color will take on either red or gold tones, depending on the intensity of the light.
Gold	Gold colors are neutralized somewhat and appear more ash than they really are. Gold colors do not appear to have the desired brightness.	Gold colors take on an added brightness. Both the red and gold tones are intensified.
Red	Red colors lose their brightness. Red colors appear more brown than red. Theoretically, the blue light should create a purple tone, but actually the color.	The red and gold tones of red colors are brightened and intensified.
Smoke	Smoke colors already have a bluish tone, and so the blue tone is intensified. Silver and platinum blonds may take on a greenish tone.	Smoke colors are neutralized. Silver and platinum colors lose their bluish tone and take on a gray tone.

Product knowledge

Objectives : At the end of this lesson you shall be to

- define product knowledge of temporary hair color
- define types of temporary hair color
- describe product knowledge of semi-permanent hair color
- determine product knowledge of permanent hair color.

Product knowledge of temporary hair color : Temporary hair dyes make it easy to switch up your color using a non-permanent hair dye alternative - you'll score tons of compliments, and the best part? It's only temporary !

Types of temporary hair color

- **Hair mascara isn't just for covering up grays:** it's an easy technique to add a fun pop of bold color. Apply the wand directly to your hair and brush on some color. It's the most temporary dye, lasting just 1-2 shampoos. (Fig 1)

Fig 1

- Hair chalk is great because of its opacity, it typically shows up on every hair color. To use, simply wet your hair, separate it into sections, then run the chalk down your strands. It lasts 2-4 shampoos. (Fig 2)
- Colored hairspray is exactly what it sounds like - hairspray with added color! Each application lasts about 2-4 shampoos. (Fig 3)
- Semi-permanent hair dye lasts at least a week. "Semi-permanent hair color molecules are larger, so they don't penetrate into the hair and instead act as a stain in the cuticle layer of the hair," explains Diaz. (Fig 4)

Fig 2

Fig 3

- Vegetable dye is the longest lasting temporary dye. The chemical-free method can "last anywhere from 1-30 shampoos, depending on how dark or saturated the tone of color is," Diaz says. (Fig 5)

Product knowledge of semi-permanent hair color : Semi-Permanent Hair Color These products are perfect for do-it-yourselfers who prefer to color their tresses at

home. Even novices can use semi-permanent hair dyes because they are often gently formulated and require no developer. Plus, they last a bit longer than temporary hair dye - usually between 6 to 8 washes. Recommend the VIA Natural Semi- Permanent Hair Color for intense color and gray coverage.

Fig 4

Fig 5

1 Clairol natural instincts hair color (Fig 6)

Fig 6

2 Iroiro premium natural semi-permanent hair color (Fig 7)

3 Manic panic (Fig 8)

Product knowledge of permanent hair color : Permanent hair color generally contains ammonia and must be mixed with a developer or oxidizing agent in order to permanently change hair color. Ammonia is used in permanent hair color to open the cuticle layer so that the developer and colorants together can penetrate into the cortex (Fig 9).

Fig 7

Fig 8

Fig 9

The developer, or oxidizing agent, comes in various volumes. The higher the developer volume, the higher the "lift" will be of a person's natural hair pigment. Someone with dark hair wishing to achieve two or three shades lighter may need a higher developer whereas someone with lighter hair wishing to achieve darker hair will not need one as high. Timing may vary with permanent hair coloring but is typically 30 minutes or 45 minutes for those wishing to achieve maximum color change. (Fig 10)

Fig 10

Allergy test procedure

Objectives : At the end of this lesson you shall be to

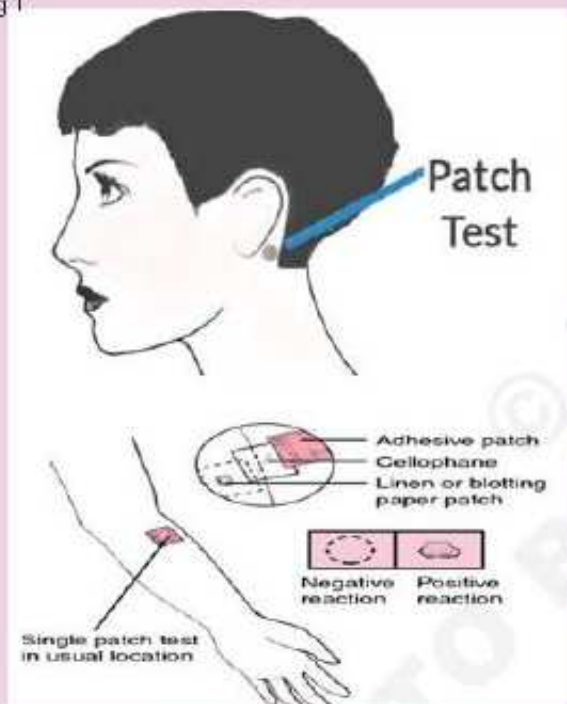

- identify allergy/ patch test
- explain the procedure of patch test.

Allergy /patch test/ pre- disposition test

Always carry out a patch test before using a permanent or semi-permanent hair dye, even if you are using your regular brand.

A preliminary patch test to determine a possible allergic reaction is required if you are using any aniline derivative color. Mix a small amount (1/2 tsp) of the chosen formula with developer according to the manufacturer's directions. Apply a small amount with a cotton tip applicator behind the ear or in the fold of the elbow. Leave undisturbed for time recommended by the manufacturer (24-72 hours), to determine if the client is allergic to this type of hair coloring (Fig 1)

Fig 1

Material required for patch test (Fig 2 & 3)

Fig 2

Fig 3

- 1 Timer
- 2 Neck Cap
- 3 Mild Shampoo
- 4 Towel
- 5 Selected Color
- 6 Per-oxide or Developer
- 7 Mixing Bowl (Glass/ Plastic)
- 8 Measuring Spoon
- 9 Protective gloves
- 10 Spray Bottle with water
- 11 Neck Strip
- 12 Tint Brushes
- 13 Setting Clip
- 14 Tail Comb

Procedure for patch test

1. Seat client comfortably at your station.
2. Wash your hands.
3. Drape your client.
4. Cleanse a small area behind the ear or in the fold of the elbow with mild soap (low pH) and water. Remove cleanser with cotton saturated with water.
5. Mix ½ teaspoon of selected color with peroxide, according to manufacturer's directions. Blend thoroughly.
6. Apply color to cleansed area with a cotton swab.
7. Advise client not to touch the patch-test area.
8. Check for any indication of redness, swelling, or irritation after the recommended time. Note results on the client's record card. If the patch test shows signs of irritation, suggest an alternative coloring product to which the client does not react.

Procedure of applying all types of hair color (Temporary hair color)

Objectives : At the end of this lesson you shall be to

- explain the procedure of applying temporary hair color
- explain the procedure of applying rinse hair color
- explain procedure of applying color shampoo
- procedure of applying temporary hair color sprays
- procedure of applying temporary hair color crayons and mascara

Procedure of applying temporary hair color :

Temporary hair color is designed to coat the hair shaft until the hair is shampoo.

Procedure of applying rinse hair color : A color rinse is a hair-dyeing method that gives your strands a wash of color instead of a permanent change. It only penetrates the outer cuticle of your hair, so it's commonly used to add vibrancy between dyeing sessions. You also don't have to use a hair color rinse to change up your strands.

How to use a hair rinse in your routine : Follow our step-by-step guide below to learn the proper way to use a hair rinse.

Step 1: Wash your strands : In order for a hair rinse to work its magic, it's essential to make sure that your strands are clean and hydrated. Set the stage with the Deep Nourish Shampoo and Deep Nourish Conditioner.

Step 2: Apply the hair rinse : Once your locks are washed, it's time to bring a hair rinse into the mix. Apply the hair rinse all over damp hair and massage it onto your scalp and throughout your strands.

Step 3: Let it sit : Don't immediately wash the hair rinse out of your hair. Give the product five to 10 minutes to do its thing on your locks.

Step 4: Rinse out your hair : Once the time is up, thoroughly rinse your hair with lukewarm water. Allow your strands to air dry and style as desired. (Fig 1)

Fig 1

Procedure of applying color shampoo Rinse out the dye

- 1 Soak your hair thoroughly with running water. This is more important if you've left the dye in so long that it has dried out.
- 2 Gently wash your hair with color care shampoo
- 3 Keep rinsing your hair until the water starts running clear
- 4 Apply conditioner.

5 Allow your hair to air dry. (Fig 2)

Fig 2

Procedure of applying temporary hair color sprays : Follow these simple steps to give your hair a (temporary) hair color change.

Step 1: Choose your hair color(s): If it wasn't already obvious, you won't be able to color your hair temporarily without first picking out which color, or colors, you want to use. Try picking one shade that suits your look or a few that will blend beautifully together. You can also seek out pictures for inspiration and consider whether you want your updated color all-over or if you prefer peek-a-boo hair or dip-dyed hair.

Step 2: Protect your clothes : Place a towel around your shoulders to protect your clothing.

Step 3: Shake, shake, shake. Shake the can well before each use.

Step 4: Get ready to spray. Hold the can four to six inches away from dry hair and spray. What to keep in mind: Less is more! Over-spraying your hair may cause hair to feel dry. Also, if you're looking for all-over color, you may need to use more than one can, depending on the length and thickness of your mane.

Step 5: Be patient. Wait a few minutes for the color to dry completely.

Step 6: Style. Style your hair as you wish. (Fig 3)

Procedure of applying temporary hair color crayons and mascara : Hair mascara isn't just for covering up grays; it's an easy technique to add a fun pop of bold color. Apply the wand directly to your hair and brush on some color. It's the most temporary dye, lasting just 1-2 shampoos. (Fig 4)

Fig 3

Fig 4

Hair crayons is great : because of its opacity, it typically shows up on every hair color. To use, simply wet your hair, separate it into sections, then run the crayons down your strands. It lasts 2-4 shampoos. (Fig 5)

Fig 5

Procedure of applying all types of hair Color (Semi-permanent color)

Objectives : At the end of this lesson you shall be to
 • apply semi-permanent color.

Introduction

There are a variety of semi permanent color available to you as a professional stylist. Some are self- penetrating and do not require a developer. Some require a predisposition, or patch test. Become familiar with the hair color products that are available. The following is semi permanent the basic procedure.

Materials

1. Towels,
2. Timer,
3. Plastic,
4. Cap optional,
5. Tint cape,
6. Wide-tooth comb,
7. Record card,
8. Protective cream,
9. Plastic clips,
10. Stylist's smock,
11. Protective gloves,
12. Cotton,
13. Applicator bottle or mild shampoo (low pH),

14. Plastic or glass bowl and tint brush,

15. Selected semi permanent color(s)

Procedure for applying semi permanent color

1. Seat client and drape.
2. Check results of patch test, if required, and record on client's card.
3. Shampoo the hair, rinse, and towel-blot. Dry hair if recommended by the manufacture.
4. Apply protective cream around hairline and over ears. (Fig 1)

Fig 1

- 5 Put on protective gloves.
- 6 Mix the formula according to the manufacturer's directions.
- 7 Begin application where the most color change is desired and apply from scalp to ends.
- 8 Work the color through to the ends with your hands. Saturate the hair thoroughly without massaging into the scalp. Pile the hair loosely on top of the head.
- 9 If required, place a plastic cap over the hair. Secure with a plastic clip, and place you client under a preheated dryer to activate the color.
- 10 Follow the manufacturer's directions for timing and for removal of the color from the hair. Some semi permanent colors contain shampoo in the original formulation and additional shampoo may not be necessary.
- 11 Rinse thoroughly and carefully cleanse the hairline area. Shampoo excess color from the hair if needed.
- 12 Condition and moisturize the hair with a mild acid product for two to five minutes and remove by rinsing.
- 13 Fill out record card.
- 14 Style client's hair. Use less heat and tension if you are thermal styling.
- 15 Recommend the appropriate retail products for the client to use at home.
- 16 Clean up styling and shampoo areas. (Fig 2)

Fig 2

Procedure of applying all types of hair Color (Permanent color)

Objectives : At the end of this lesson you shall be to

- **apply permanent color.**

Permanent tint application

Aniline derivative tints give the greatest range of hair coloring options. This is the type of color you will apply most often. Permanent color involves a chemical reaction inside the hair. For best result, mix the color just prior to application (oxidation begins immediately). Apply the color quickly and thoroughly, beginning where the color is needed most, or where the hair is more resistant. Be aware of the timing as you work to complete the coverage. Become acquainted with the manufacturer's recommendations for the color product you are using, and consult with your instructor before proceeding.

Materials

- 1 Towels,
- 2 Timer
- 3 Plastic clips,
- 4 Mild acid conditioner,
- 5 Tint cape,
- 6 Moisturizer,
- 7 Protective cream,
- 8 Protective gloves,
- 9 Cotton,
- 10 Applicator bottle or plastic or glass bowl and tint brush,
- 11 Mild shampoo (low PH),
- 12 Tint product, Developer, Client record card

- 13 Spray water bottle,
- 14 Stylist's smock (Optional)

Procedure for applying tint to virgin hair

- 1 Seat your client comfortably and drape.
- 2 Check the results of the patch test for any signs of redness or irritation. Proceed only if the skin is clear.
- 3 Shampoo the hair if necessary, or as guided by your instructor or manufacturer. Use caution avoid any scalp manipulations during the shampoo.
- 4 Apply conditioning treatment if indicated by your analysis. Ask your instructor if a clarifying treatment should be given to neutralize any coating or chemical buildup on the cuticle of the hair.
- 5 Perform a strand test.
- 6 Section the hair into four equal sections.
- 7 Apply protective cream around the hairline and over the ears.
- 8 Put on protective gloves.
- 9 Mix formula according to strand test results and manufacturer's directions.
- 10 Apply the tint, starting in the most resistant area.
 - a If you are going lighter, this will be the darkest area. Begin applying at the mid shaft.
 - b If you are going darker, it will be the lightest, or most gray area. Begin application at the scalp, outlining

the section first. Part off a ¼ to ½ inch horizontal subsection. Apply the color to the mid shaft area, beginning ½ inch from the scalp and continuing up to, but not through, the porous ends. Lift the subsection up and apply to the bottom of the hair. Lay the hair up toward the crown and proceed to the next ¼ to ½ inch subsection. Work quickly and rhythmically for best results. Lift the hair from the scalp and gently turn sections back over. Avoid packing the hair against the scalp.

- 11 Quickly move the next section, outlining it if the application is going darker. Apply color, lift the hair from the scalp, and turn it over to the original position.
- 12 Set your timer according to your strand test results.
- 13 Cross-check each section by gently making vertical partings and adding more color formula, as necessary.

While you cross-checking, make certain color does not contact the scalp. If it does, gently blot with a damp towel.

- 14 Check timing by removing color from a subsection five minutes before timer indicates. Mist the subsection with water and towel dry to evaluate results. If color is not complete, re-saturate subsection and continue timing.
- 15 When the center strand has developed according to your strand test results, apply color to the scalp area up to the mid shaft.
- 16 Again, according to your strand test results, work the tint formula through the ends and time.
- 17 Take a final strand test to confirm your timing and the result a desire.

Contra - action

Objectives : At the end of this lesson you shall be to

- explain contra action.

Contra- action

These are conditions which may arise during the treatment which would indicate that the treatment must stop.

During a treatment be aware to any abnormal changes happening with the client. These changes can signal you should stop performing the treatment.

- 1 Headache,
- 2 Nausea,
- 3 Vomiting,
- 4 Profuse sweating,
- 5 Restlessness and Irritability,
- 6 Feeling faint,
- 7 Abnormal Erythema,
- 8 The area is becoming very hot and red,
- 9 Stomach or any abdominal pain,
- 10 Joint pain,
- 11 Muscle fatigue,
- 12 Bruising.

If any of these conditions arise, remove any product and slowly place the client in the recovery position to allow the client to rest for 10 minutes or so.

Stay with the client until she or he feels better. Allow the client to sit up slowly and rest in this position. If there is still cause of concern seek medical advice.

Fig 1

Contra - indications

Objectives : At the end of this lesson you shall be to

- explain contra indications.

Contra- indications

As part of your beauty treatment training you would have been taught to check with your client whether they have any contra indications to the treatment they are having

before starting the treatment. A contra indication is defined as a medical condition that may restrict or prevent a treatment being carried out.

These vary depending on the type of treatment being performed.

No therapist wants a claim to be made against them so to minimise the risk of receiving a claim,

- 1 It is important to carry out a full consultation with your client prior to the treatment. It is during this consultation you will be able to obtain any information regarding your client's medical history and whether they have any allergies.
- 2 If your client has a Chemical allergy. No product should be used during the treatment that contains any kind of chemical allergy. No product should be used during the treatment that contains any product those are allergic for blind.
- 3 Some conditions prevent the treatment being carried out, for example, if your client has ringworm (tinea capitis) and came to you for a hair colour then this condition would prevent you from carrying out the treatment. If you hadn't asked your client during the consultation process as to whether they had any medical conditions and you proceeded with the treatment then this could result in an adverse reaction being caused along with distress to your client and

again the possibility of your client making a claim against you.

- 4 The nature of your treatment it is paramount to ask your client 'do you have any allergies?' 'Do you have medical conditions that may affect us carrying out treatment on you today?' 'do you have allergies or reactions to certain brands?'
 - 5 Another common issue for hairdressers is head lice. They spread like wild fire, potentially to you, other colleagues and other clients and your work tools.
You have every right to refuse to work on a client with head lice and you can discreetly, professionally tell them that you unfortunately can't work on them until they have their head lice treated.
- As we all know from our training there are many contra actions and contra indications that we as professionals must follow - they are in place for a reason - to protect your client from injury and to protect our reputations and business.

Safety precautions

Objectives : At the end of this lesson you shall be to

- explain safety precautions.

Safety precautions

People who dye their hair should follow these safety precautions

Follow the directions in the package. Pay attention to all "Caution" and "Warning" statements.

- 1 Do a patch test before using dye on your hair. Here's how: Rub a tiny bit of the dye on the inside of your elbow or behind your ear. Leave it there for two days. If you get a rash, don't use the dye on your hair. You should do the test each time you dye your hair. (Salons should also do the patch test before dyeing your hair.)

- 2 Hurt your eyes. You might even go blind. FDA does not allow using hair dyes on eyelashes and eyebrows.
- 3 Keep hair dyes out of the reach of children.
- 4 Don't leave the dye on longer than the directions say you should.
- 5 Rinse your scalp well with water after dyeing.
- 6 Wear gloves when you apply the hair dye.
- 7 Never mix different hair dye products. This can hurt your hair and scalp.

Straightening/ rebonding / smoothing (Definition)

Objectives : At the end of this lesson you shall be to

- define of straightening/ rebonding /smoothing
- explain types of hair rebonding
- explain knowledge of hair structure.

Definition

Hair rebonding is a chemical process that changes your hair's natural texture and creates a smooth, straight style. It's also called chemical straightening.

The multistep process breaks the natural bonds that exist in your hair follicle, then rebuilds these bonds into a different shape. This changes the way that your hair looks.

Rebonding vs. smoothing

Rebonding is similar to but different from other hair smoothing processes, such as keratin treatments and Brazilian hair straightening. Hair smoothing processes aim to smooth down your hair cuticle, making it less frizzy and adding softness.

But hair rebonding actually breaks apart the hydrogen bonds in your hair before fusing them back together. Hair rebonding gets your hair more straight than any other process, but it also carries a high risk of hair damage. (Fig 1)

Fig 1

Hair Rebonding	Hair Smoothing
Rebonding is a chemical straightening treatment that uses cream relaxant and neutralizers to straight the hair	Hair smoothing is a chemical process that saturates the hair using formaldehyde solution
This treatment more in straightening the hair	This treatment more in making hair frizz free, smooth, shiny and manageable
Alter the hair structure	Doesn't affect the hair structure that much
May provides an artificial looks to hair	Provides natural straight looks to the hair
Lasts for about 6 to 7 months	Lasts for about 3 to 4 months
Ideal for too heavy, unmanageable, curly hair	Ideal for frizzy and wavy hair

Types of hair rebonding

- 1 Hair straightening:** Hair straightening uses chemicals that can turn even the roughest and most unmanageable hair into soft, straight hair. However, your hair may appear flat and dull due to reduced density. If you already have thin hair, it can look very sleek and fragile after straightening. Once new hair starts growing, it will not be straight. The difference in the hair on the roots and the straightened hair will become more evident. Thus, your hair will need root touch-ups every few months.
- 2 Hair smoothening:** Hair smoothening does not require the application of harsh chemicals and excess heat on the hair, making it a safe way of rebonding your hair. In this treatment, the flat iron is set at a lower temperature. It is ideal if you want to prevent scalp damage.

When new hair grows, the difference is not very noticeable as smoothened hair is neither too flat nor straight. Your hair feels more manageable and looks natural.

- 3 Keratin treatment:** Keratin is a protein that constitutes 91% of your hair. Chemical treatments damage your hair's keratin bonds. Keratin treatments add a layer of the protein to make your hair healthier and manageable.

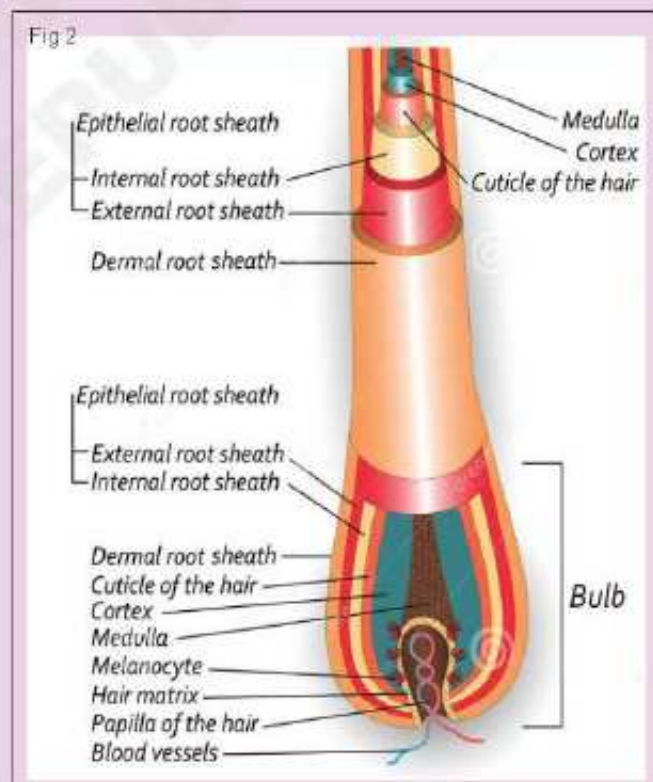

There are two types of keratin hair rebonding

- A Brazilian blowout:** It uses chemicals, including formaldehyde, that makes your hair frizz-free and soft, while making it more manageable and easy to style. It lasts up to 3 months.
 - B Smoothing treatments:** Keratin nourishes the hair and adds shine without changing its texture. Smoothing therapies do not use formaldehyde, making them a safer alternative. They usually last for six months.
- 4 Volume rebonding:** Volume rebonding helps your hair obtain more volume and fullness. It allows certain parts of the hair to be permed or slightly curled to enhance your natural look. It has a more natural effect on your hair.
 - 5 Volume body perm:** Volume body perm uses emollient chemicals and heat, making it suitable for thin and damaged hair. You can undergo this treatment frequently to increase your hair's volume. It is not like conventional hair treatments that use strong chemicals or excessive heat.

Knowledge of hair structure : A hair can be defined as a slender, thread-like outgrowth from a follicle in the skin. The hair are present all over the body, except for the sole, palm, lips. Hair is composed of structural protein called keratin. This is the same kind of protein that makes up the nails and the outer layer of skin.

- Rises of three morphological regions - the cuticle, medulla, and cortex
- An innermost layer or medulla which is only present in large thick hairs.
- The middle layer known as the cortex. The cortex provides strength, colour and texture of the hair.
- The outermost layer is known as the cuticle. The cuticle is thin and colour less. It serves as a protector of the cortex.

Structure of the hair root : Hair root lies below the skin, which is enclosed within a follicle. At the base of hair follicle is the dermal papilla. The dermal papilla is fed by the blood vessels which carries nourishment to produce new hair. The dermal papilla is very important for the growth of the hair as it contains receptors for male hormones and androgens. The presence of these receptors is responsible for the androgenetic alopecia. (Fig 2)

Knowledge of bonds

Objectives : At the end of this lesson you shall be to

- define knowledge of bonds
- explain disulphide bonds, salt bonds, hydrogen bond.

Knowledge of bonds

Hair bonds : I think most of us already know that our hair is made up of a strong fibrous protein called keratin. And

deep within the structure there are linkages and cross-bonds that create a network of strength that reinforce the hair fiber. This protein contains many copies of the amino

acid cysteine, which is special because it has a sulfur containing chemical group that allows it to form strong bonds with other sulfur containing molecules.

There are three types of hair bonds: hydrogen bonds, salt bonds and disulfide bonds. Collectively, these bonds are also known as side bonds. Side bonds link chains of the hair's amino acids together and each type of side bond contributes approx. 33% to the hair's overall hair strength.

Disulphide bonds : Disulfide bonds are also known as Cystine bond, Sulfur bond or S bond. These bonds are the strongest and the protein structures of the hair shaft are held together by chemical bonds called disulfide and hydrogen bonds. The more disulfide that occurs in the fiber, the curlier and kinkier the hair. These bonds cannot be broken by water or heat manipulation. Only chemicals agents can break these bonds, like perms, relaxers or color. So if a person with curly hair wants straight hair, you would need to use chemicals that can break up or "relax" these bonds. After the disulfide bonds break, relaxers "cap" the bonds so that they cannot reform again. It's the reason why relaxers cannot be stripped or undone. Once broken, disulfide bonds cannot be reformed.

Hair elasticity is heavily dependent upon these key factors:

- 1 Hydrogen bonding between water molecules and keratin strands and
- 2 Disulfide bonds between adjacent cysteine amino acid groups, both of which are dependent upon preservation of the protein structure and hydration of the cortex.\
- 3 The best approach to ensure excellent elasticity is to maintain an intact protein structure inside the cortex and an adequate level of hydration".

Salt bonds: These bonds are abundant throughout the cortex. Salt bonds account for nearly 1/3 of the hair's strength. They are broken by pH changes in the hair in both acid and alkaline direction. It is easily broken when a

substance of a pH of 5.5 or greater is applied. Readjusting the hair's pH will reform and stabilize these bonds. Salt bonds are formed when the positive end of an amino chain links to another amino acids negative end.

(Hair structure and chemistry simplified ."chemical composition of hair" in Texas Collaborative: A closer look at the properties of Hair and scalp. "Fundamental Properties of Afro- American Hair as related to Their Straightening/relaxing behavior")

Hydrogen bond: These bonds are the most flexible. Hydrogen bonds are easily broken in the presence of water and heat. They are the primary bonds responsible for changing our hair's overall shape.

They are responsible for up to 30% of the strength and up to 50% of its elasticity. When the hair is wet by either shampooing/conditioning or in the presence of humidity, the molecules that enter the fiber move in and break up the hair's preset hydrogen bonds and form new ones.

Hydrogen bonding allows our hair to change shape temporarily and produces a strong hold. Here is an example of hydrogen bond manipulation resulting in an altered appearance of the hair: setting your hair in rollers. Hair is usually set in rollers while wet. The hair is then held in position until it dries. As the hair dries, hydrogen re-bonding occurs, but in the new "shape".

The sugar bond: Is formed between the side of the chain of amino acid having an OH (oxygen bonded to a hydrogen) group and an acidic amino group. This bond is also formed perpendicular to the axis of the hair. This bond accounts for little strength and moisture retention.

All Hair pHix products are formulated with keratin protein, keratin amino acids, and cystine amino acids, ensures whether environmental, chemical, or heat induced will be repaired or reversed. Hair pHix improves hair strength and vitality by as much as 10 times greater than other conventional professional products available today

Client consultation

Objectives : At the end of this lesson you shall be to

- client consultation.

Client consultation : A consultation allows both you and the client to set realistic expectations for the service result. It also sets aside time before the service begins to review any previous chemical services that might affect the outcome. This information is easy to collect with a form completed prior to the consultation.

The ASK team have put together the following step by step guide, to help you master the perfect client consultation.

The consultation is the opportunity to start building a relationship with the client and determine exactly what your clients needs are. Use this opportunity to learn as much as you can about their likes and dislikes past

experiences, good and bad as well as general lifestyle issues that are relevant to their hair.

The following steps are intended as a guide to conducting a thorough professional consultation:

- Greet and seat the client in a styling chair for consultation.
- Introduce yourself to new clients by name. If you don't already know their name, ask them and make a concerted effort to remember and use it.
- It is important to have the client seated without being gowned up so as you get an indication of their sense of style.

- Ask the client what they have in mind and listen to their response.
- Observe the client's hair be aware of texture, length, growth patterns, hairlines and general body shape and height. Observe facial characteristics such as face shape, ears, nose, and neck.
- Use photographs as references when appropriate. Ask questions such as 'how much time do you spend on your hair each day?'
- Make sure you and your clients are speaking the same language what is short hair to a client may be medium length to you, what you mean by warm may be bright red to a client.
- Ask how the hair was dried the last time it was shampooed as it may have been straightened, ask what styling products have been used.
- Once a look has been decided upon reaffirm what needs to be done to achieve it and recap what the end result will look like. Remember most clients who are unhappy with their hair are usually the victims of bad communication rather than a bad haircut or color.
- Once in agreement put a gown on the client and if they are having their hair cut first take them to the backwash for shampooing. Explain to the client any products used at the backwash and the reason for using them on his or her hair.
- Use photographs as references when appropriate. Ask questions such as 'how much time do you spend on your hair each day?'
- Make sure you and your clients are speaking the same language what is short hair to a client may be medium length to you, what you mean by warm may be bright red to a client. (Fig 1)
- Ask how the hair was dried the last time it was shampooed as it may have been straightened, ask what styling products have been used.
- Once a look has been decided upon reaffirm what needs to be done to achieve it and recap what the end result will look like. Remember most clients who are unhappy with their hair are usually the victims of bad communication rather than a bad haircut or color.
- Once in agreement put a gown on the client and if they are having their hair cut first take them to the backwash for shampooing. Explain to the client any products used at the backwash and the reason for using them on his or her hair.

Fig 1

Scalp analysis

Objectives : At the end of this lesson you shall be to

- define scalp analysis, porosity test
- define diameter test, elasticity test.

Scalp analysis

How to analyze your client's hair : Hair analysis is an important element of client consultation helping you to determine the condition of the hair and scalp.

Always explain any procedure before starting a treatment; if there is any doubt about the end result, the client must be informed. It is recommended that a diagnostic record card be used to record all aspects of a consultation. It may be appropriate to ask the client to sign a document, stating they are in agreement with the suggested course of action and are aware of any reservations you may have.

The senses of sight, smell and touch provide a wealth of information to the skilled stylist. However, further direct testing is required to confirm the condition of the cortex, the porosity of hair, any allergic sensitivity to a product, and the presence of chemicals from previous treatments.

Porosity test

Porosity is a measure of the hair's capacity to absorb moisture. Damaged hair will be highly porous, with an open cuticle layer exposing the inner cortex. Hair in this condition will look dull and dry, and may be prone to breaking. The more porous hair is, the faster a treatment will take effect, and processing times should be adjusted accordingly.

With one hand, select an individual hair or group of hairs at the tip of the shaft. With the other hand, slide thumb and first finger down the hair strand(s) from the tip to the base. Assess how rough or smooth the hair is, using the following guidelines to determine a course of action:

Smooth and glassy : The cuticle is dense and hard. Hair with poor porosity may lack moisture and will be resilient to treatment.

Slightly rough

This usually indicates healthy, normal hair.

Rough, Very rough, brittle and dry

Indicates damaged hair, which may be the result of over processing. Use a repair treatment or cut out the damaged parts. (Fig 1)

Fig 1

Diameter test: Fine hair will normally be more prone to excessive oil or overloading; conversely, thick hair may take longer to react to a treatment. Assessing the diameter of hair will provide useful information when deciding on a repair treatment or adding color or curl.

With experience, feeling the hair is often all that is required, however a calibrator will accurately test hair diameter. Place an individual hair between the gauges and read the scale to determine hair type. It is worth noting that hair is often oval, or slightly flattened in profile, and so several readings should be taken in order to analyze the diameter correctly.

Elasticity test: The elasticity of hair can determine the condition of the cortex; well-conditioned hair is springy and bouncy. In order to test for elasticity, take a single strand of hair between both thumbs and forefingers and stretch the hair (it may be necessary to detach a hair from the client's head).

Healthy hair will stretch roughly an extra 1/3 its length and return to original size. Damaged hair may not return fully to original size, while dry or brittle hair may break when put under tension. Use the results from this test to determine whether additional care is required prior to any treatment or style.

Too porous: hair may have been treated previously. Use a pre-conditioning product.

Product knowledge

Objectives : At the end of this lesson you shall be to

- define product knowledge
- define scalp analysis, porosity test.

Product knowledge: There are three general categories of relaxers available.

- There are thioglycolate, acid, and hydroxide relaxers.
- The hydroxide types are used more frequently in the salon.
- Thio relaxers are closely related to the development of permanent waves.

Thioglycolate relaxers

These relaxers contain thio (the same ingredient used in permanent wave solution) this relaxer is a thick cream or a gel; the weight of the product will help remove curl from the hair.

How it works

When the relaxer is applied, usually to shampooed hair, the cuticle layer is softened. the hair is then combed or smoothed until the desired degree of curl is removed. the disulfide bond in the cortex is broken as the curl is removed once the curl has been removed as desired, the relaxer cream is rinsed from the hair and the hair is neutralized in its straighter position. The disulfide bonds

are reformed in the straight position. this is often done through a net, especially if the hair has been molded in to a style shape or waves.

Thio relaxers are often not effective on coarse hair textures or on hair that has extreme curl. extra care has to be taken to keep the relaxer off the scalp, especially the combing phase.

Use protective cream to protect the hair line and blot any thio that contacts the scalp. (Fig 1)

Fig 1

Acid relaxers

- These relaxers also work like permanent waves.
- The active ingredient is usually a bisulfite.
- These relaxers are very mild in their action and are more often used in a soft curl process than as a relaxer alone. (Fig 2)

Fig 2

- You should always research the manufacturer's directions and consult with your instructor before you combine different chemical products in a service.

If the chemicals are not compatible, your service will not be successful and you risk damaging your client's hair and scalp.

Hydroxide relaxers

- Relaxers based on sodium hydroxide work on an entirely different principle; they are most often used to remove curl from the hair.
- These relaxers are usually available in a cream formation in varying strengths of mild, regular and super; the difference between the strengths depends upon the percentage of active ingredients, which varies between 5 and 10 percent.
- These relaxers are alkaline in pH, ranging at 10.0 and above. The alkalinity forces the cuticle to soften so that the relaxer can penetrate in to the cortex layer of the hair.

How it works

- Once there, the sodium hydroxide (NaOH) breaks the disulfide or sulfur bond. When this happens, the hair will smooth out to a straighter form due to the weight of the cream, the pressure of smoothing, or in extremely curly hair—the gentle combing of the hair.
- Once the hair has relaxed to the desired degree of smoothness, take your client to the shampoo bowl and rinse very thoroughly. This rinsing is necessary to remove all traces of relaxer from the hair so that its action is stopped. (Fig 3)

Fig 3

- You will speed this process by using warm water and gradually increasing your water pressure from a moderate setting.
- Rinse the hair from the scalp out to the ends, avoiding excessive pressure around the hair line. Lift the hair from the crown and separate layers in the back to ensure thorough rinsing.
- Lift the client's head gently so that you can remove all traces of relaxer in the nape.
- The temperature of water is important and should be comfortably warm. Hot water could damage the hair, cause scalp irritation, and be extremely uncomfortable for your client. Water is too cool, on the other hand, will not remove the oil and wax bases that form the relaxer cream, thus leaving the relaxer to continue processing.
- Next, and most important, shampoo the hair thoroughly. An acid-balance (4.5 to 5.5) shampoo is recommended as the acid will neutralize any remaining alkali inside the hair shaft.
- Shampoo the hair until it rinses clear with warm water. This may take as many as three shampoos if the relaxer you choose has a heavy wax base. The hair should then be deep conditioned according to your analysis.

A lanthionine bond is a permanent bond and cannot be broken or altered any further. It is for this reason that sodium relaxers were once referred to as perm (permanent) to separate them from temporary pressing methods. (Fig 4)

Fig 4

Potassium hydroxide is often an ingredient in sodium relaxers and occasionally is used as the primary active ingredient. These relaxers work in the same manner as sodium and are also referred to as "lye" relaxers. (Fig 5)

Fig 5

Calcium hydroxide relaxers work on the same chemical principle as those outlined previously. Calcium hydroxide is slightly milder and works slowly on the hair. Many professional technicians feel that calcium hydroxide relaxers are more damaging to the cuticle layer of the hair and leave it in a more roughened state. Calcium hydroxide relaxers are often mistakenly referred to as "no lye" relaxers. (Fig 6)

Base cream A base cream is a petroleum cream designed to protect the scalp during a relaxing service. They cover the scalp with a thin, oily coating and prevent irritation or burning from the relaxer cream. A protective cream should be used around the hair line and over the ears before beginning any relaxer application. (Fig 7)

Fig 6

Fig 7

Strand test knowledge & procedure

Objectives : At the end of this lesson you shall be to

- explain the strand test knowledge and procedure.

Strand test knowledge and procedure: Because every head of hair reacts differently to chemicals, you should perform a strand test before each relaxer service. A strand test must be done if you are at all unsure about results.

- Follow the manufacturer's instructions for the product selected. The directions will include guidelines for timing, safety and application.

Procedure for strand testing

- 1 Select a ½ - inch square section at the back of the head.
- 2 Place the strand over a strip of foil or transparent plastic.
- 3 Apply the relaxer to the strand.
- 4 Fold the strip over the strand to protect the rest of the hair.
- 5 Process the strand until the desired degree of relaxation has been achieved. Note timings. (Fig 1)
- 6 Rinse the strand thoroughly with a spray bottle. Towel blot excess relaxer.
- 7 Apply shampoo to the strand only and massage through. Rinse with the spray bottle and reapply until the strand is completely clean.

- 8 Compare strand to virgin hair to determine if you have the result you want.
- 9 Analyse the condition of the hair. Make necessary adjustments to formula and techniques chosen for application to the entire head.
- 10 Cover the strand test liberally with protective cream to prevent reprocessing during the full service.

Before treating fragile or porous hair, it is important to carry out a strand test. The test will Overprocessed hair is usually very dry and often loses its elasticity.

Fig 1

Step by step procedure of straightening/rebonding/smoothening

Objectives : At the end of this lesson you shall be to

- **step by step procedure of straightening/ rebonding/smoothening**
- **procedure for sodium hydroxide relaxer.**

Sectioning the hair

Part the hair into four or five sections for control , the most common sectioning is into four parts, so that you can equally process the entire head .

- First, part the hair from the front hairline to the nape of the neck into two equal sections.
- Next , part the hair from ear to ear, across the crown of the head.
- Secure each section with a large plastic clip.

Some technicians prefer to use three sections in the front.

- First, part the hair from ear to ear over the top of the crown. split the back section into two equal parts and clip securely.
- Next, section out a panel from the crown to the front hair line.
- Clip this and each of the two remaining side sections.

Applying the base

- Most of today's relaxers are "no base". however, you may select a relaxer that requires the use of a base to protect the scalp.
- To apply, release one of the sections. Part the hair into a subsection 1/2 to 1 inch in thick ness and apply the base directly to the scalp. continue through each section applying base to the scalp only.
- Apply protective cream around the hair line, over the ears, and at the base of the nape to all heads, whether a base is used or not.

Material required for relaxer

- 1 Relaxer
- 2 protective cream
- 3 Timer
- 4 Neutralizing shampoo
- 5 Conditioner
- 6 Plastic clips
- 7 Towels
- 8 Gloves
- 9 Record card
- 10 Neck strip
- 11 Wide-tooth comb
- 12 Applicator brush

13 Plastic cape

14 Spatula

15 Spatula or comb

The following is the procedure for a sodium hydroxide ,no- base relaxer on virgin hair.

Before beginning any relaxing service , thoroughly read the manufacturer's instructions for the particular product you are using

Procedure for sodium hydroxide relaxer

- 1 Seat client comfortably at your station.
- 2 Sanitize your hands.
- 3 Drape client and ask him or her to remove neck and ear jewellery.
- 4 Do not irritate the scalp by brushing or shampooing.
- 5 Analyse hair and scalp. Record results. have client sign release form.
- 6 Perform a strand test. Make notes of results and timing. The total timing will be your guide for application and processing of the entire head. (for example, if the strand processed in 20 minutes. you must be able to apply relaxer to all four sections, cross check) And begin final strand – testing in 20 minutes.
- 7 Section the hair and clip securely.
- 8 Apply base if needed or recommended by the manufacture.
- 9 Apply protective cream around entire hair line and over ears. put on your protective gloves.
- 10 Open relaxer container. Place the container on terry towel to prevent slipping during application. Select applicator.
- 11 Release one back section of hair. Set the timer as directed by the manufacturer and the strand -test timing.
- 12 Outline the section, except the hair line, with relaxer. Begins application ½ inch from the scalp.
- 13 Part a ½ inches horizontal subsection, beginning at the top of the first quadrant. Hold subsection straight out from the head and apply the relaxer to the top. Begin ½ inch from the scalp and apply out to, but not through, the ends. Apply relaxer to underside of the stand in the same manner. Lay the hair up. Out of the way and quickly proceed to next subsection.
- 14 Quickly apply to the entire quadrant in this manner until you reach the hairline. Lift the subsections away from the top of the head, turning them back down to the nap.

- 15 Proceed in the same manner in the second back section. Outline the section, part off a ½ inch subsection and quickly apply to the top and bottom of the subsection. Apply from ½ inch away from the scalp up to, but not through, the ends. Avoid application at the hairline.
- 16 Continue around the head by applying to the adjoining front section. Outline the section and apply to each subsection as described in step 14. avoid pressing the hair down to the scalp.
- 17 Apply relaxer to the last section. You should have used half, or less, of your total timing.
- 18 Immediately begin cross-checking your application in the last quadrant. part the hair vertically. apply relaxer to the area closer to the scalp, to the hair line, and to any areas that you may have missed. if any relaxer should touch the scalp, thoroughly blot it away with a damp towel. Cross check the entire fourth quadrant.
- 19 Move the third quadrant and use vertical parting to cross-check. Apply relaxer to the hair near the scalp and the hairline. add any additional relaxer as needed.
- 20 Cross-check the second quadrant where you applied relaxer, then the first. Apply relaxer to the hair near the scalp. You should have one quarter, or more, of your total time remaining.
- 21 Work the relaxer through the ends according to your analysis of the hair.
- 22 Test the action of the relaxer by slightly stretching a small sub-section and seeing how fast the natural curl is being removed. Remove the relaxer from the strand with your gloved finger. Watch for the degree of relaxation and for the amount of curl that returns as you release the hair. You do not want to completely straighten the hair this cause excess damage and give you no styling options. Remove curl until the hair has a loose, controllable wave.
- 23 Smooth the hair only as necessary to even processing. gently lift the hair from the scalp, stretching slightly and smoothing the relaxer into the subsection today's relaxers are formulated to need little, if any smoothing.
- 24 When the timer indicates that processing should be finished, remove the relaxer from several strands. Select a strand from the front, the back, and the side hairline. Place the strand over a towel. Remove excess relaxer and mist with water if needed to assess relaxation. if processing is not complete, work relaxer back into the hair. When processing is complete proceed with your client to the shampoo bowl.
- 25 Seat the client comfortably at the shampoo bowl, making certain that all of the nape hair is inside the bowl. Adjust the water so that the temperature is warm and pressure is medium. As you will be wearing your gloves, check that the client is comfortable with the water temperature. Water that is too hot will burn the client and cause hair damage. Ater that is too cool is also uncomfortable and will not stop the action of the relaxer.
- 26 Rinse the hair thoroughly. Use one hand as a shield around the hair line so water does not splash into the client's eyes. lift the hair in sections out away from the head so that you can completely rinse the relaxer from the underneath layers. lift the client's head gently and rinse the nape area, pay attention that no chemical remains this area in.
- 27 Rinse the hair from the scalp out to the ends until all traces of the relaxer are removed and the hair no longer foams. This step stop the action of the relaxer and is extremely important.
- 28 Remove your gloves.
- 29 Shampoo the hair with an acid-balanced shampoo or the neutralizing shampoo provided by the manufacturer. Apply the to the palms of your hands, work them together, and gently begin manipulation on the hair. Work underneath the hair to prevent tangling and to ensure that all the hair is shampooed. This step neutralizes the chemical action inside the hair and forms the new lanthionine bond.
- 30 Rinse and repeat as necessary until the hair lathers well and rinses clear. Frequently, three shampoos are necessary to ensure that this phrase of the relaxing process is complete.
- 31 Apply conditioner according to manufacturer's instructions, your analysis of the hair, and your instructor's directions. Time as necessary, rinse, and towel-blot.
- 32 Style the hair, using caution to avoid excess heat or stretching.
- 33 Complete and file the record card; clean your station and shampoo area.
- 34 Suggest your client purchase the products to maintain the hair and the style at home. Give any tips that would be helpful.

Contra - action

Objectives : At the end of this lesson you shall be to

- explain contra- action and contra-indication.

Contra-action

These are conditions which may arise during the treatment which would indicate that the treatment must stop.

During a treatment be aware to any abnormal changes happening with the client. These changes can signal you should stop performing the treatment.

Allergic Reactions One of the most common contra-actions to the chemicals used to smoothening your hair is swelling of the head and eyes area due to an allergic reaction.

Eye Irritation Another common side effect of smoothening is eye irritations.

Pre-existing conditions the scalp should also be checked for cuts, scrapes and bruises because damaged skin could react unfavorably to the tint, due to its heightened sensitivity.

Erythema is another common contra-action of Smoothening. Defined as a reddening of the skin due to skin injury or inflammation, erythema is an irritation of the skin that often follows Smoothening treatments and can last for several days.

Patients should be advised of this possible contra-action before they are given any chemical service or Smoothening.

Contra - indications

- Some Disadvantages of Hair Smoothening
- Scalp irritation with burns and blisters.
- Hair loss.
- Hair breakage or damage.
- Dandruff.
- Excessive split ends.
- Headaches.
- Nausea.
- Chest tightness.

Safety precautions

Objectives : At the end of this lesson you shall be to
• **explain safety precautions.**

Safety precautions

When giving a chemical relaxing treatment, you can never be too cautious. Here is a review of the safety measures that will ensure a comfortable and safe treatment for your client.

- 1 Examine the scalp for abrasions; if any are present, do not give a hair relaxing treatment.
- 2 Analyze the hair; give a strand test.
- 3 Do not relax damaged hair. Suggest a series of conditioning treatments. In extreme cases it may be advisable to cut off the damaged hair.
- 4 Do not shampoo the hair prior to the application of a sodium hydroxide product.
- 5 Do not apply a sodium hydroxide relaxer over a thio relaxer.
- 6 Do not apply a thio relaxer over a sodium hydroxide relaxer.
- 7 Never use a strong relaxer on fine hair, as it may cause breakage.
- 8 Cool or warm irons may be used on chemically relaxed hair. Do not use excessive heat, as it may cause damage to relaxed hair.
- 9 Apply a protective base, to avoid burning or irritating the scalp with the sodium hydroxide relaxer.
- 10 Wear protective gloves.
- 11 Protect client's eyes.
- 12 Use extreme care when applying the relaxer to avoid accidentally spreading it on the ears, scalp, or skin.
- 13 Strand test the action of the relaxer frequently to determine how fast the natural curl is being removed.

- 14 Be sure to thoroughly rinse the relaxer from the hair. Failure to do so permits the relaxer to continue to process, resulting in hair damage. Direct stream of warm water from scalp to hair ends.
- 15 Wear protective gloves until all the relaxer has been removed. When rinsing the shampoo from the hair, always work from the scalp to the ends, to prevent tangling the hair.
- 16 Use a wide-tooth comb and avoid pulling when combing the hair after the relaxation process is complete. Avoid scratching the scalp with comb or fingernails.
- 17 Apply a conditioner to the scalp and hair before setting the hair.
- 18 When retouching the new growth, do not allow the relaxer to overlap onto the hair already straightened.
- 19 Do not give a hair relaxing treatment to hair treated with a metallic dye.
- 20 At the completion of each treatment, fill out a complete record card.
- 21 Have the client sign a release statement to protect the salon and the cosmetologist.
- 22 It is not advisable to use chemical relaxers on lightened hair, which is already in a weakened condition.
- 23 Hair should not be relaxed or straightened more than 80%. To go beyond that point may severely damage the hair.

After care/home care

Objectives : At the end of this lesson you shall be to

- explain after care/home care.

After care /home care

Immediately after the hair smoothening treatment Procedure:

- Do not wet hair for 3 days.
- Do not tie your hair or put it behind your ears.
- While sleeping, ensure your hair is straight.

3 days after the hair smoothening procedure

- Wash your hair with shampoo and conditioner after three days. Leave the conditioner on for a few minutes longer than usual.
- Avoid hot water at all times as it will strip your tresses of moisture.
- Use a wide toothed hair comb to separate the strands. Remove any tangles with great care. No matter what the temptation, do not use a hair brush.
- Apply a hair serum regularly. This creates a barrier between your hair and outside damage from dust, sun and pollution.
- Use a leave in conditioner. This helps in retaining the moisture and keeps dryness and frizz away.
- Use hair masks frequently or get hair spas done that will add vitamins to your hair and replenish the nutrients lost because of chemical compounds.

15 days after the hair smoothening procedure

Follow a nutritious diet of nuts, cashews, almonds and lots of fruits and vegetables.

- Have your hair trimmed on a regular basis. This ensures your hair remains in top condition. Make sure there are no split ends.
- Avoid use of any heating tools. If you have to blow dry, then go on the cool blast mode.
- Your hair needs to relax after the high dose of straightening chemicals, so no colouring or highlighting for at least 6 months.
- Keep your hair safe from environmental factors – harsh sun rays, cold winds and the rains. Use a hat or an umbrella.
- Use anti-frizz spray to moisturize dry hair and prevent your hair from getting entangled.
- Do not tie up your hair, or use hair pins, because they will leave a corrugated mark that is difficult to straighten back.
- If your hair does not get greasy, stay away from shampooing every day. Shampoo alternate days or try co-washing – simply use a conditioner as a shampoo and rinse it away.
- Healthy hair shows it's been taken care of – smooth to touch and frizz free. Incorporate our intensive hair care routine for longer-lasting strength, shine and bounce.

Indian traditional beauty concept (Henna)

Objectives : At the end of this lesson you shall be to

- define heena
- state the precautions for heena
- define after care for heena
- define bindi
- state the precaution for bindi application.

Define heena

Henna is a woody shrub that thrives in hot and arid climates. The henna plant produces extremely fragrant and delicate flowers, which have been used in perfumes since ancient times. The leaves of the henna plant are harvested, dried, and then ground into a fine powder. This lovely silken green powder is made into a paste using safe and natural ingredients. (Fig 1 & 2)

Fig 1

Fig 2

The paste is applied to the skin using a fine tipped applicator or cone, and produces the familiar burgundy stains that have decorated the hand and feet of women for thousands of years. People of Africa, India and the middle east have traditions infused with the act of applying heena during auspicious and celebratory times.

Precautions for heena

- Keep henna paste on as long as possible (4-12 hours is ideal).
- Do NOT wash off with water. Gently scrape dried henna off.
- Use olive oil or lemon juice to remove stubborn bits of henna, if needed.
- Avoid water on the henna for the rest of the day.
- The longer you avoid water, the darker your stain will become.
- Avoid chemicals (cleaners), chlorine, smoothing lotion, and abrasive soaps.
- If you make a mistake during application of heena, quickly wipe off henna with a damp cloth or paper towel or use a straight pin or toothpick to remove the mistake. (Fig 3)

Fig 3

**After care for heena**

- Optional: Apply olive oil on heena before showering or getting wet.
- Optional: If you swim, apply spray bandage sealer over heena first.
- Keep henna paste on as long as possible (4-12 hours is ideal).
- Keep the area warm if possible.

Indian traditional beauty concept (Tattoo & sari draping)

Objectives : At the end of this lesson you shall be to

- define tattoo
- state precautions for tattoo
- define after care for tattoo
- explain different styles of sari draping
- state precaution of sari draping.

Define tattoo

The word is likely related to the Samoan tatau, meaning "to strike or mark." Tattoos became popularized in the Western world when sailors began to explore the Pacific and return with them. In Japan, where there is a long historical tradition of skin art, the word irezumi refers to traditional Japanese tattoos, while tattoo is used in discussions of other types of tattoo art. Tattoo owners sometimes shorten the word to tat or use the terms ink, art, or work to talk about the designs they wear.

People receive tattoos for a variety of reasons: To identify themselves with a religious or social group, to adorn their bodies, as protective symbols, to cover skin discolorations, or as ongoing art and social projects. Most tattoo artists are themselves heavily tattooed.

Explain precautions for tattoo

- Do allergy test before applying tattoo color on skin.
- Select the design before you start applying tattoo.
- Heena is best for temporary tattoo design in place of chemical color or dye. (Fig 1)

Fig 1

- Do not wash off with water. Gently scrape dried henna tattoo off.
- Avoid water on the henna tattoo for the rest of the day. The longer you avoid water, the darker your stain will become. (Fig 2)
- If you make a mistake during application tattoo quickly wipe off henna with a damp cloth or paper towel or use a straight pin or toothpick to remove the mistake.

Fig 2

After care for tattoo

- Optional: Apply olive oil on heena tattoo before showering or getting wet.
- Keep henna tattoo as long as possible (4-12 hours is ideal).
- Keep the area warm if possible.

Different style of sari draping

A saree makes every woman look beautiful and elegant. But it is very important to drape the saree in a way that it brings out the best in you. A saree is more than just a rectangular piece of cloth - it comes in different densities of fabric and the body of the saree is often lighter than the pallu so as to let it wrap around the body easily. Its versatility and uniqueness allow for adjustments at all times and it can transform itself according to the need and function of the moment.

Northern style drape (Fig 3): In the north of India, the saree is worn the traditional way, with the end of the pallu covering the bosom. In the front, they have skirt pleats and the pallu is draped around the shoulders and over the chest, to demurely cover the bust. It's a good drape to wear when you want to look more demure, perhaps in front of elders.

Gujarati style drape (Fig 4) : This version of draping commonly known as the seedha pallu way, is also found in parts of Uttar Pradesh, Madhya Pradesh, Rajasthan and Bihar. Instead of opening to the left, the pleats are tucked so that they open to the right. Then, the pallu is

taken to the back and brought over the right shoulder. It is then spread across the chest, and the left edge is tucked in the petticoat at the back. Pear-shaped women with big hips and stomachs should try and opt for a Gujarati-style seedha pallu with minimum pleats on the stomach. Tighten the sari well so it skims your body, instead of making it look heavier.

Fig 3

Fig 4

Maharashtra method of Saree Draping Style

(Fig 5): Instead of the usual five-and-a-half meters, the sari in this version measures eight meters. The saree apes a dhoti style somewhat, with some of the fabric tucked between the legs to divide them. Worn without a petticoat underneath, this saree is rarely seen nowadays except on festive occasions. Thus it forms a kind of divided sari, allowing greater freedom of movement. In this version of the saree the pallu drapes the shoulder or is used to cover the head.

Fig 5

Bengali style (Fig 6): The saree is worn pleatless; it is wrapped around the waist, brought back to the right side and the pallu is thrown over the left shoulder. The pallu is then brought up under the right arm and once again cast over the left shoulder. Often an ornate key bunch is added to the edge to complete this very feminine and elegant drape.

Fig 6

Precautions/ tips for sari draping

- 1 Brown or dark skin color women should normally buy dark colors - like green, maroon or dark pink etc.
- 2 Georgette, chiffon or chignon saree is for the women on heavier side. Heavy Mysore Silks saree look beautiful and it tends to look slimmer.
- 3 Thin women should buy cotton, tissue, tussar sarees and organza. This will give a fuller effect.
- 4 Small borders or no borders sarees are for the shorter women. As big borders make one looks shorter, they should definitely avoid big borders.
- 5 In the case of printed sarees, try to avoid the big prints as it gives a flashy and a huge look. Delicate print on a Saree, gives a delicate look.
- 6 If you wear saree in office, you should pinup your saree. You will feel comfortable. You will look very smart and it can easily manageable.
- 7 A function or in an outing, just pinup the saree and let the rest of the saree fall on your hand. But give a careful look at the Saree that should have a good fall. This gives a very attractive look.
- 8 You should iron properly the cotton, tissue or any starched Sarees before wearing it and at the time of draping, press and shape the pleats properly, do yourself or with the help of other.
- 9 Put the pin on the back shoulder so this keeps the saree intact and it does not show the pin.
- 10 Last of all but not least - don't wear a very flared petticoat inside.
